The photochemistry of the herbicide chlorsulfuron (2-chloro-N-((4-methoxy-6-methyl-1,3,5-triazinyl-2-amino)carbonyl)benzene sulfonamide) was investigated in methanol, distilled water, natural creek-water, on silica gel and on montmorillonite surfaces. Two major photoproducts were identified in all cases. Under indoor conditions half-lives of chlorsulfuron were 92 hr in methanol, 78 hr in distilled water but only 18 hr in natural creek water. On silica gel the half-life was 60 hr while on montmorillonite powder the half-life was slightly prolonged (66 hr). This ranking of the photostability in different media was confirmed by a series of outdoor experiments under solar radiation conditions. Assuming first order kinetics the half-life times were calculated as 186 hr for distilled water, 31 hr for creek water, 136 hr for silica gel and 115 hr for montmorillonite. The stability of chlorsulfuron in methanol or water can be easily explained by the ultraviolet spectra of the compound. The significant accelerated breakdown rate in creek water samples must be due to their content of photosensitizing agents or to the generation of OH-radicals and other reactive species. (Moore-IVI)

RING TEST OF A METHOD FOR ASSESSING THE PHOTOTRANSFORMATION OF CHEMICALS IN WATER,
European Chemical Industry Ecology and T9oxicology Centre, Brussels (Belgium).
J. Lemaire, J. A. Guth, O. Klais, J. Leahey, and W. Merz.
Chemosphere, Vol. 14, No. 1, p 53-77, 1985. 2 Fig, 10 Tab, 14 Ref.

Descriptors: *Photochemistry, *Pentachlorophenol, *Dichlorophenol, *Dichloroaniline, *Nitrophenol, Phenols, Anilines, Fate of pollutants, Computers.

Seven types of apparatus have been used to measure the quantum yields for direct phototransformation in water of 4 chemicals (pentachlorophenol; 2,4-dichlorophenol; 3,4-dichloroaniline; 4-nitrophenol) under polychromatic (12 laboratories) and monochromatic (3 laboratories) light, according to a common test protocol. The results with both types of light were in good agreement. The reproducibility and accuracy of quantum yields obtained with the ECETOC/University of Clermont-Ferrand apparatus with polychromatic light (6 laboratories) were similar to or better than those obtained with monochromatic light. A disadvantage of the method with polychromatic light is that the calculation is more complicated, but this can be overcome by the use of a desk-top computer. On the other hand experiments with polychromatic light permit the determination of quantum yields of substances of low photo-reactivity. (Author's abstract)

EFFECT OF HYDROCARBON MIXTURES ON ADSORPTION OF SUBSTITUTED NAPHTHALENES BY CLAY AND SEDIMENT FROM WATER,
Virginia Inst. of Marine Science, Gloucester Point.
W. G. MacIntyre, and P. O. deFur.
Chemosphere, Vol. 14, No. 1, p 103-111, 1985. 1 Fig, 5 Tab, 9 Ref.

Descriptors: *Naphthalenes, *Hydrocarbons, *Adsorption, Clay, Sediments, Fuel, Fate of pollutants, Mixtures, Isotherms.

Similarity of adsorption coefficients for a compound from hydrocarbon mixtures in water solution and from the single compounds in water solution would indicate that different hydrocarbons at low concentrations do not compete for adsorption sites when surface coverage is imcomplete, and that the hydrocarbons do not interact in aqueous solution. Adsorption of methyl and dimethyl napthalenes, and of these compounds as components of JP8 aviation fuel and synthetic jet fuel mixtures, was measured on two sediments and montmorillonite clay in water. Isotherms were linear, and hydrocarbons of similar structure gave similar adsorption coefficients on a particular clay or sediment. Individual component adsorption co-

efficients were dependent upon mixture composition, but coefficients usually varied by less than a factor of two. This implies that single component adsorption coefficients may be adequate for use in environmental fate models of hydrocarbon mixtures. It is probable that results obtained pertain to mixtures containing other non-polar solutes such as chlorinated hydrocarbons. (Moore-IVI)

EFFECT OF FLOOD CONDITIONS ON THE GROUNDWATER QUALITY OF A BOREHOLE AT BARODA NEAR CRADOCK, EASTERN CAPE PROVINCE,
Orange Free State Univ., Bloemfontein (South Africa). Dept. of Geology.
E. A. W. Tordiffe, W. A. Van Der Westhuizen, and H. De Bruiyn.
Water S. A., Vol. 11, No. 1, p 33-34, January, 1985. 2 Fig, 1 Tab, 5 Ref.

Descriptors: *Floods, *Groundwater pollution, *Baroda, *South Africa, Irrigation effects, Chlorides, Sulfates, Sodium, Salts.

Analyses of groundwater samples taken at various time intervals over a period of several months from a single borehole, proved that significant changes in the inorganic quality occurred after periods of extreme flood conditions. The main changes which occurred, one and a half months after devastating floods, were an increase in the Cl(-), SO4(2-) and Na(+) concentration, while only a slight decrease in the HCO3(-) concentration was detected. This phenomenon is attributed to accumulation of salts in the soils and rocks above the groundwater table during normal conditions and the flushing thereof due to extremely wet conditions. The present practice of over-irrigation in the area due to readily available Orange River water could simulate similar flood conditions. (Author's abstract)

WATER QUALITY OF A SMALL URBAN CATCHMENT NEAR DURBAN, SOUTH AFRICA,
Durban-Westville Univ. (South Africa). Dept. of Geography.
G. du T. De Villiers, and E. Malan.
Water S. A., Vol. 11, No. 1, p 35-40, January, 1985. 2 Fig, 3 Tab, 15 Ref.

Descriptors: *Water pollution sources, *Catchment area, *Urban areas, *South Africa, Water quality, Wastewater pollution, Dissolved solids, Sodium, Chlorides, Ammonium, Industrial wastes, Swimming pools.

A preliminary study of baseflow water quality was conducted at a small urban catchment about 15 km northwest of Durban, South Africa. An attempt was made to explain the variations in anion and cation concentrations through on site inspections and discussions with the relevant local authorities. The geological formations in the catchment, consisting mainly of Table Mountain Sandstone, have a limited effect on the water quality. Pollution in the catchment is rather the determining agent. Mineralization of the surface waters is still reasonably low, with the mean total dissolved solids for the period at all the sampling points at 185 mg/l. The waters are dominated by sodium with the relative concentrations Na>Ca>Mg>K. The relatively high chloride content measured at some stations in a residential area could possibly be attributed to swimming pool effluent. The high SO4 concentration at one station is due to spillage by at least two industrial concerns. The relatively high NH4-N concentration at some sampling stations could be due to spillage from an industry and seepage from sewerage overflow. (Moore-IVI)

DEPOSITION AND PROCESSING OF AIRBORNE NITROGEN POLLUTANTS IN MEDITERRANEAN-TYPE ECOSYSTEMS OF SOUTHERN CALIFORNIA,
Pacific Southwest Forest and Range Experiment Station, Riverside, CA.
P. J. Riggan, R. N. Lockwood, and E. N. Lopez.
Environmental Science and Technology, Vol. 19, No. 9, p 781-789, 1985. 5 Fig, 5 Tab, 42 Ref.

Descriptors: *Air pollution, *Nitrates, *Atmospheric deposition, *California, Water pollution sources, Groundwater pollution, Streamflow, Throughfall, Precipitation, Fire, Chaparral, Grasslands.

Atmospheric nitrogen deposition, associated with chronic urban air pollution, has produced stream water nitrate concentrations as high as 7.0 mg of N/L in chaperral watersheds in the San Gabriel Mountains of Los Angeles County, CA. Stream water NO3(-) concentration and discharge were greatest at high flow and may contribute significantly to existing groundwater NO3(-) pollution. Annual NO3(-) discharge ranged from 0.04 to 10.0 kg of N/ha over 4 years. Canopy throughfall and precipitation inputs of 23.3 and 8.2 kg of N/ha/year were high relative to other undisturbed ecosystems nationwide. Dry deposition was apparently a major source of the throughfall nitrogen. NO3(-) concentrations from nearby, relatively unpolluted watersheds were lower by 1-3 orders of magnitude. NO3(-) yield was elevated on watersheds where chaparral was converted to grassland in 1960 and may be greatly accelerated after wildfire because of high postfire NH4(+) concentrations and rapid nitrification in terrestrial and aquatic ecosystems. SORBENT CONCENTRATION EFFECTS IN LIQUID/SOLID PARTITIONING,
Michigan State Univ., East Lansing. Dept. of Civil and Environmental Engineering.
T. C. Voice, and W. J. Weber.
Environmental Science and Technology, Vol. 19, No. 9, p 789-796, 1985. 8 Fig, 4 Tab, 22 Ref.

Descriptors: *Lake sediments, *Sorption, *Model studies, *Partition coefficients, Lake Michigan, Hexachlorobiphenyl, Trichlorobiphenyl, Naphthalene, Chlorobenzene, Organic matter.

Partition coefficients developed in laboratory sorption studies have been observed to vary inversely with the concentration of sorbent solids utilized in the experimental system. A model was developed that relates this phenomenon to the complexation, or binding, of the solute by nonseparable organic matter in the liquid phase, and the subsequent sorption of both free and bound solute. It can be shown that linear partitioning in the resulting bisolute system can produce the nonlinear sorption anomalies that have been observed in isotherm studies. The model was calibrated to previously reported sorption data involving four hydrophobic environmental contaminants - 2,4,5,2',4',5'-hexachlorobiphenyl, 2,5,2'-trichlorobiphenyl, naphthalene, and chlorobenzene - and three Lake Michigan sediment samples. The strengths and weaknesses of the model along with its environmental implications are discussed. (Author's abstract)

t.
Environmental Contamination and Vol. 14, No. 5, p 587-594, September, 6 Ref.

*Great Lakes, *Pesticides, *Priority *Fish, Polychlorinated biphenyls, Chlorinated hydrocarbons, Aromatic compounds, Aliphatic compounds, Benzene compounds, Rivers, Tributaries, Harbors.

Composite fish samples collected from Great Lakes harbors and tributaries between 1980 and 1981 were analyzed by gas chromatography and gas chromatography-mass spectrometry for a wide range of pesticides and priority pollutants. Severe polychlorobiphenyl (PCBs) contamination was observed in Sheboygan River fish with moderate to severe PCB contamination in samples from the Milwaukee, Kinnickinnic, Fox, and Ashtabula Rivers. The Ashtabula River samples also contained several chlorinated aromatic and aliphatic hydrocarbons. Polynuclear aromatic hydrocarbons were detected in fish from the Black, Kinnickinnic and Menominnee Rivers, while a number of benzene derivatives were observed in samples from the Fox and Wolf Rivers. TEMEPHOS RESIDUES IN STAGNANT PONDS AFTER MOSQUITO LARVICIDE APPLICATIONS BY HELICOPTER,
Environmental Research Lab., Gulf Breeze, FL.
E. M. Lores, J. C. Moore, P. Moody, J. Clark, and J. Forester.
Bulletin of Environmental Contamination and Toxicology, Vol. 35, No. 3, p 308-311, September, 1985. 2 Fig, 10 Ref.

Descriptors: *Temephos, *Pesticide residues, *Water analysis, *Water pollution effects, Water pollution sources, Insecticides, Organophosphorus compounds, Organic compounds.

The concentrations of temephos in water were measured so that the application rates could be confirmed for this organophosphate insecticide to control mosquito larvae. Results are reported from residue analysis of water from two stagnant ponds following actual field applications of larvicide by helicopter at treetop level in South Florida. Site 1 was less than 0.05 ha in surface area, less than 10 cm deep, and completely covered by a tree canopy. Site 2 was greater than 0.5 ha in surface area, less than 10 cm deep and the canopy was open in the middle. The recommended application rate on the label of the 4-E formulation for mosquito larvae control is 0.5 to 1.5 fl oz/acre. Calculated residue concentrations for the intended 1 oz/acre application rate used in the study range from 250 micro-g/l for water that is 1 inch deep to 42 micro-g/l for waters that are 6 inches deep. These calculations predict concentrations of temephos that are very close to the measured concentration found immediately after the sprays. Field test results indicate that the pesticide remains intact in water up to 48 hours, and residues as high as 62 micro-g/l are found. A problem of stabilization in this study was overcome by using mineral oil as an extracting solvent until the samples could be returned to the laboratory. (Baker-IVI)

ORGANOCHLORINE HYDROCARBON RESIDUES IN SEDIMENTS OF TWO DIFFERENT LAGOONS OF NORTHWEST MEXICO,
Universidad Nacional Autonoma de Mexico, Mexico City. Inst. de Ciencias del Mar y Limnologia.
M. T. L. Rosales, R. L. Escalona, R. M. Alarcon, and V. Zamora.
Bulletin of Environmental Contamination and Toxicology, Vol. 35, No. 3, p 322-330, September, 1985. 3 Fig, 1 Tab, 7 Ref.

Descriptors: *Lagoons, *Mexico, *Yavaros lagoon system, *Huizache-Caimanero lagoon system, *Sediments, *Organic compounds, *Chlorinated hydrocarbons, Hydrocarbons, Salinity, Seasonal variation, Pesticide residues, DDT.

Sediment samples were collected seasonally during a 21 month period from the Yavaros lagoon system in Sonora Mexico and the Huizache-Caimaneros lagoon system in Sinaloa Mexico. The concentration of organochlorine residues at each sampling station was determined. Higher concentrations of organochlorine compounds in the Yavaros area were usually found from October to January. However there was not a clear distribution pattern. The highest values observed were: HCH 10.45, heptachlor 5.4, aldrin 1.85, heptachlor epoxide 4.29, dieldrin 5.85, and total DDT 7.62 micro-g/kg. The values are higher in Moroncarit lagoon and in the estero linking Moroncarit and Yavaros lagoons. Yavaros lagoon has a uniform salinity of about 37% which reflects a high marine influence. Organochlorine hydrocarbons concentration in the Huizache-Caimanero system is higher in July. The concentration of these compounds apparently follows an annual cycle which is related to the evaporation-precipitation cycle of these lagoons. The persistence of HCH in submerged tropical soils is not very long due to the microflora degradation of this compound. The cycling presence of DDT in the Huizache-Zaimanero system was unexpected. The levels of organochlorine compounds determined in the areas studied are within the same order of magnitude as those reported earlier. Total DDT values ranged from 3 to 21 micro-g/kg. (Baker-IVI)

EFFECTS OF GUT SEDIMENT CONTENTS ON MEASUREMENT OF METAL LEVELS IN BENTHIC INVERTEBRATES - A CAUTIONARY NOTE,
E.V.S. Consultants Ltd., North Vancouver (British Columbia).
P. M. Chapman.
Bulletin of Environmental Contamination and Toxicoloy, Vol. 35, No. 3, p 345-347, September, 1985. 1 Tab, 5 Ref.

Descriptors: *Sediments, *Metals, *Invertebrates, *Benthic fauna, Copper, Zinc, Lead, Iron, Manganese, Nickel, Cobalt, Tubificids, Larvae, Lampreys, Midges.

Sediments were collected subtidally in the Lower Fraser River, British Columbia for metal analysis. Three groups of organisms were collected in sufficient biomass for heavy metals analysis. Gut sediment weight of tubificids averaged 14.99% of total weight, however the metal load contributed by the gut sediment varied from a mean value of 16.4% for zinc to a mean value of 39.7% for nickel. In the case of ammocoetes larvae, average gut sediment weight was less than that for tubificids, but the metal load contributed by this sediment was much higher than in tubificids. Values varied from a mean of 20.7% for zinc to a mean of 62.0% for lead. Chironomid larvae were only occasionally collected so the sample size is small, but gut sediment metal contents also comprised a high percentage of the total metal load. It is important that digestions of whole benthic animals for tissue metal analysis include a gut sediment correction. (Baker-IV)

SUPERFICIAL ACCUMULATION OF HEAVY METALS IN NEAR SHORE MARINE SEDIMENTS: AN OBJECTIVE INDEX OF ENVIRONMENTAL POLLUTION,
Instituto de Investigaciones Pesqueras, Cadiz (Spain).
R. Establier, A. Gomez-Parra, and J. Blasco.
Bulletin of Environmental Contamination and Toxicology, Vol. 35, No. 3, p 348-353, September, 1985. 2 Fig, 2 Tab, 8 Ref.

Descriptors: *Bay of Cadiz, *Spain, *Heavy metals, *Marine sediments, *Sediments, Vertical distribution, Fate of pollutants, Zinc, Manganese, Iron, Copper, Lead, Cadmium, Salt ponds, Aquaculture.

The effect of civilization has been evaluated in the Bay of Cadiz, Spain. This area represents a densely populated and relatively enclosed coastal zone having a special interest due to the use of its salt ponds as fish farms. The vertical distribution of six heavy metals and other complementary parameters were studied at a few sampling-stations, chosen as representative sedimentary environments of this zone. A Superficial Enrichment Factor was established. In general, the content of organic carbon

and heavy metals in the sediments of this zone appeared to be determined by the granulometry of the bottom, although the vertical trend of these parameters is conditioned by the proximity of the sample station to the outlets of the urban and industrial effluents of the area. The most pronounced concentration gradients of metals correspond to the northern area, where the greater number of effluents are located. The progressive reduction with depth of typically polluting metals occurs to some extent in all the sampling stations, and an extremely complex situation was found in the more superficial layer, mainly due to changes in the redox conditions of the environment. The Superficial Enrichment Factors Values are quite variable depending on the metal and the sampling station considered. The quantities of iron and manganese have not increased greatly in recent years. In the salt ponds the influence of anthropogenic activity was similar to other places where the movement of the water is not restricted. The complex hydrodynamics of the area may give rise to anomalous distributions for some heavy metals. (Baker-IVI)

ATRAZINE HYDROLYSIS IN SOILS: CATALYSIS BY THE ACIDIC FUNCTIONAL GROUPS OF FULVIC ACID,
Department of Agriculture, Ottawa (Ontario). Chemistry and Biology Research Inst.
D. S. Gamble, and S. U. Khan.
Canadian Journal of Soil Science, Vol. 65, No. 3, p 435-443, August, 1985. 3 Fig, 2 Tab, 25 Ref.

Descriptors: *Atrazine, *Hydrolysis, *Fulvic acid, *Soil water, *Fate of pollutants, Herbicides, Humic substances, Soil solution, Mathematical equations.

The catalysis of atrazine hydrolysis at 25.0 C by the types of acidic functional groups found in humic materials has been investigated. No evidence of catalysis by carboxylate ions was observed. From a knowledge of the types and number of acid functional groups in a quantitatively characterized fulvic acid, and the distributions of their KA values it was found that hydrogen ions and undissociated carboxyl groups were the only catalytic agents. The carboxyl groups have a second-order k sub AH of 7.88/days/M. Weakly acidic functional groups having Ka approximately = 10 to the 10th power showed no catalysis. A predictive equation has been produced for the half-life of atrazine in fulvic acid solutions at 25.0 C. It represents a general class of equations which should permit the practical prediction of atrazine persistence in soil solutions and other natural waters. (Author's abstract)

DISSOLVED COLOURED COMPOUNDS AND SUSPENDED MATTER IN THE WATERS OF THE MIDDLE WAIKATO RIVER,
Department of Scientific and Industrial Research, Taupo (New Zealand). Div. of Marine and Freshwater Sciences.
M. H. Timperley.
New Zealand Journal of Marine and Freshwater Research, Vol. 19, No. 1, p 63-70, 1985. 3 Fig, 1 Tab, 22 Ref.

Descriptors: *Suspended solids, *Color, *Waikato River, *New Zealand, Aromatic compounds, Turbidity, Hydroelectric plants, Organic compounds, Industrial wastewater, Pulp wastes.

Concentrations of suspended matter and filtrable hydroxylated aromatic compounds (HAC) together with turbidity and light absorbance measurements at 270 and 750 nm are reported for monthly samples, over one year, of water from the tailraces of the nine hydroelectric power stations on the Waikato River, North Island, New Zealand. Between Lakes Aratiatia and Karapiro the suspended matter concentrations increase 3-fold. The concentrations of HAC increase only slightly in all lakes except Lake Maraetai where a 3-fold increase occurs because of Kraft bleach effluent from the New Zealand Forest Products Limited, Kinleith Mill. This effluent also causes a marked increase in the absorbance at 270 nm, a measure of the brown color attributable to dissolved organic compounds. The HAC in the effluent are linearly related to absorbance at 270 nm. The use of these easily measured parameters for detecting changes in water appearance, i.e., color and clarity, are discussed. Measurements of light scattering, either turbidity or absorbance, appear to have sufficient sensitivity to detect changes in relative water clarity. The ratio of inorganic to organic suspended matter increases down the river and measurements of these two components could be used to detect changes in water appearance resulting from changes in the suspended matter composition. The absorbance at 270 nm of filtered water is a convenient and sensitive indicator of dissolved color but a range of unidentified compounds contribute to this absorbance and for control of the brown coloration caused by timber processing effluents, limits on the discharge of HAC may be more useful. (Author's abstract)

Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4073, 1984. 68 p, 18 fig, 23 tab, 48 ref.

Descriptors: *Oil shale, *Leaching, *Groundwater, *Surface water, *Water quality, Geology, *Kentucky, Knobs physiographic region, Groundwater movement, *Water pollution sources.

Oil shales in Kentucky are rocks of predominantly Devonian age. The most prominant are the Ohio, Chattanooga, and New Albany Shales. A leaching study was done on six fresh oil shale samples and one retorted oil shale sample. Leaching reagents were distilled water, 0.0005 N sulfuric acid, and 0.05 N sulfuric acid. The concentration of constituents in the leachates were highly variable. The concentration of sodium, manganese, and zinc in the retorted shale leachate was several orders of magnitude higher than those of the leachates of fresh shale samples. The major oil shale outcrop covers approximately 1,000 square miles in a horseshoe pattern from Vanceburg, Lewis County, in the east, to Louisville, Jefferson County, in the west. The Kentucky, Red, and Licking Rivers cross the outcrop belt, the Rolling Fork River flows along the strike of the shale in the southwest part of the outcrop, and the Ohio River flows past the outcrop at the ends of the horseshoe. Oil shale does not appear to significantly alter the water quality of these streams. Oil shale is not an aquifer, but seeps and springs found in the shale indicate that water moves through it. Ground water quality is highly variable. (USGS)

INVESTIGATION OF RELATION AMONG POLLUTANT LOADINGS AN STOCK LEVELS IN NORTHEASTERN ARIES,
Martin Marietta Environmental Systems, bia, MD.
T. T. Polgar, J. K. Summers, R. A. Cummi A. Rose, and D. G. Heimbuch.
Estuaries, Vol. 8, No. 2A, p 125-135, June Fig, 2 Tab, 14 Ref.

Descriptors: *Potomac River, *Fish pop *Time series analysis, *Water pollution eff tuaries, Fish, Climates.

Time series analysis by regression of ca variables seems promising for investigatin ant effects on stocks. The method develo is attractive in that it yields comparative a abilistic measures of pollutant effects re other population control factors. Addition egorical regression models seem to expla spectable amount of stock variability, g limited reliability of landings, effort, and data. These types of analyses will be ext other species, pollutants, and estuaries project progresses. In the current study gorical time series regressions were used preliminary relationships among previous stock size, climatic variables, and pollutio tors. The analysis technique evaluated hy on the effects of human population cha dredging activity on stock histories of the estuary's striped bass and American shad period 1929 through 1976. While climati dominate striped bass dynamics compare two pollution variates tested, the Ameri stock showed strong dependence on hum lation levels, but not on dredging activ pared to climatic factors. hication of large coastal lagoons in
nd is discussed including definition of
of the problem, identification of the
utrient inputs and development of man-
iatives. The lagoons, known locally as
lie on the glacial outwash plain of
d's south shore and are separated from
narrow coastal barriers. The nitrogen
unit area of the salt ponds are 240-770
sq m per year. Nutrient enrichment of
ns has led to increased growth of
oalgae. This increased growth appears
benthic habitat and shift it from a
detrital food chain which is impacting
t shell fisheries. The major sources of
uts to the salt ponds are identified as
nitrogen inputs from streamflow,
, runoff, precipitation and tidal inflow
re. The groundwater is the dominant
which nitrogen enters the salt ponds.
nanagement initiatives are proposed to
from present and potential develop-
the watersheds of the lagoons. These
cus on two issues. The first is to
nt loadings from already densely developed areas. The second is to reduce the potential for further development in as yet sparsely developed areas within the watershed. The plans call for an aggressive program to maintain existing septic systems and to replace failing systems; to build and maintain settling basins for major sources of surface runoff; to limit extension of sewers into already densely developed areas; to restrict extension of water supply systems to within pond watershed boundaries so that future tie-ins do not withdraw substantial amounts of freshwater influx from one pond and divert it to another; to require buffer strips of natural vegetation around the shoreline of the ponds to minimize runoff and protect intertidal habitat; and to mount a sustained educational campaign to promote public appreciation for the problems and the need to support these measures. IMPACT OF DISCHARGES FROM SEAFOOD PROCESSING ON SOUTHEASTERN ESTUARIES,
Georgia Univ., Brunswick. Marine Extension Service.
K. W. Gates, B. E. Perkins, J. G. EuDaly, A. S. Harrison, and W. A. Bough.
Estuaries, Vol. 28, No. 2B, p 244-251, June, 1985. 2 Fig, 5 Tab, 20 Ref. National Sea Grant Program grant 04-8-M01-175.

Descriptors: *Georgia, *Food processing wastes, *Estuarine environment, Industrial wastes, Water pollution effects, Nutrients.

The effects of effluents on two of Georgia's estuarine systems were studied. The systems included a relatively undeveloped area consisting of three small estuarine creeks, two of which are normally exposed to seafood packing by-products, and a large commercially and industrially developed estuary that receives effluents from a seafood processing plant and three packing houses. The environmental impact of current seafood processing wastes on estuaries in Georgia appears to be minimal when compared with the natural organic load. The large estuary demonstrated a high residual capacity to receive processing effluents without significant change. The BOD load from shrimp thawing, peeling, sorting, and cleaning operations at the large seafood processing plant was shown to be equivalent to the organic material generated by a 302 sq m plot of salt marsh. NH4-N levels were greater than, but the same order of magnitude as, natural runoff from marsh land. (Baker-IVI)

EFFECTS OF CONTAMINANTS ON TOXICITY OF THE LAMPRICIDES TFM AND BAYER 73 TO THREE SPECIES OF FISH,
National Fishery Research Lab., La Crosse, WI.
L. L. Marking, and T. D. Bills.
Journal of Great Lakes Research, Vol. 11, No. 2, p 171-178, 1985. 4 Tab, 24 Ref.

Descriptors: *Great Lakes, *Lampricides, *Fish, *TFM, *Bayer 73, *Water pollution effects, Synergism, Fish management, Pesticides, Organic compounds, Pesticides, Metals, Industrial wastes, Tannic acid.

Nontarget fish were exposed to combinations of lampricides and contaminants that may be present in the Great Lakes basin, with the objectives of quantifying the additive toxicity of certain paired mixtures, demonstrating the effects of combining two or more selected pesticides, and calling attention to the potential hazards of applying chemicals in aquatic environments where contaminants already exist. The toxicities of combinations of lampricides with organic pesticides, metal, industrial or municipal pollutants, and tannic acid were mostly additive. The toxicity of a combination of TFM, Delnav, and malathion was synergistic, and extremely small quantities of each chemical became lethal when mixed. Toxicities of the pesticides in the combination also increased commensurately. The triple combination of chemicals produced extraordinary synergism and effectively demonstrated the hazards that may result if certain chemical combinations occur in the aquatic environment. Synergism is not the only kind of toxic action that produces hazards to aquatic organisms. All three types of toxic action are of concern because toxic units produced by contaminant chemicals add to the toxic units of applied management chemicals. Since the toxicity of the majority of chemical combinations is simply additive, this cumulative toxic action contributes more total units to aquatic environments than the extreme actions of less than additive and synergism. The toxicity of the lampricide TFM, as well as other management chemicals, is reinforced by the presence of any contaminant that contributes additional units of toxicity. (Baker-IVI)

EFFECTS OF ENVIRONMENTAL AND BIOLOGICAL VARIABLES ON THE TOXICITY OF MERCURIC CHLORIDE,
D.A.V. Coll., Muzaffarnagar (India). Pollution Relevant Research Lab.
S. R. Verma, R. Chand, and I. P. Tonk.
Water, Air, and Soil Pollution, Vol. 25, No. 3, p 243-248, July, 1985. 4 Tab, 31 Ref.

Descriptors: *Toxicity, *Mercuric chloride, *Fish, Water pollution effects, Temperature effects, Dissolved oxygen, Acidity, Fish populations.

The effects of environmental and biological variables on the toxicity of mercuric chloride to the fish Notopterus notopterus were evaluated. Temperature, dissolved oxygen concentrations, acidity, and fish size play a major role in the toxicity of mercuric chloride, especially in bioassay tests. Thus these variables need special attention whenever the results of bioassay are given with reference to chemicals. This will also help in determining a more reliable tool for calculation of the maximum allowable toxicant concentration and application factor for chemicals to be used in the field. (Baker-IVI)

EFFECTS OF EFFLUENT OF MUNICIPAL WASTEWATER ON THE GROWTH OF PORPHYRA YEZOENSIS IN THE CASE OF STATIC CULTURE (IN JAPANESE),
Tokyo Univ. of Fisheries (Japan).
T. Maruyama, A. Miura, and T. Yoshida.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 51, No. 2, p 315-320, February, 1985. 9 Fig, 2 Tab, 10 Ref.

Descriptors: *Water pollution effects, *Porphyra, *Macrophytes, *Activated sludge, Salinity, Plant physiology, Plant growth, Absorbance spectra, Spectroscopy.

The effects of unchlorinated activated sludge effluent from a municipal sewage treatment plant on the growth of Porphyra yezoensis were investigated for different effluent dosages with different degrees of salinity by means of in vitro static culture. To clarify the effect of the effluent on the Porphyra thalli, the length of thalli and the absorbance spectra of living thalli were measured every two days. The number of dead cells in a thallus were counted using a microscope 10 days after the start of the culture, followed by a erythrosine staining. While increasing the effluent dosage to about 5% by volume, the relative length of thalli decreased rapidly and the number of dead cells quickly increased, and they were enhanced with the lower salinity. When the effluent dosages was above 5%, the relative length of thalli and the number of dead cell had a definite value for each degree of salinity. The absorbance spectra (350-750 nm) and absorbance ratio (567 nm/676 nm) of living thalli increased when the effluent dosage and

exposure time were increased. The above mentioned results suggest that the activated sludge effluent of municipal wastewater may have an adverse effect on the growth of Porphyra thalli. (Author's abstract)

INVESTIGATIONS ON PARAQUAT TOXICITY IN FISHES,
Jozsef Attila Univ., Szeged (Hungary). Dept. of Biochemistry.
J. Nemcsok, L. Orban, B. Asztalos, Z. Buzas, and A. Nemeth.
Water International, Vol. 1, No. 2, p 79-81, June, 1985. 5 Fig, 12 Ref.

Descriptors: *Herbicides, *Paraquat, *Fish, *Toxicity, Organic compounds, Agricultural chemicals, Water pollution effects, Enzymes.

The sensitivity of three fish species with different feeding habits to paraquat contamination was examined. Treatments with 1 and 10 ppm paraquat, respectively, increased the transaminase enzyme activity of all three fish species investigated to about the same extent. The treatment with 100 ppm (which due to its deadly effect lasted less than 15 minutes) did not result in measurable transaminase increase in any of the species. LDH and blood glucose level proportionally increased with respective paraquat concentration applied, including the lethal 100 ppm treatment. Asphyxia was one of the accompanying symptoms of the sudden death of fishes due to high paraquat concentration. Preceding their death, fish were air-breathing with difficulty and tried to jump out of the aquaria. Scarlet red discoloration of abdominal veins could be noted during post motem examination. The change of serum cholinesterase activity on paraquat treatment of various concentrations differed in two of the fish species; 10 ppm paraquat decreased it by 40% in carp and by 30% in silver carp. The 100 ppm lethal dose also decreased serum cholinesterase activity. The points of paraquat's attack and results of attack include injury of liver and kidneys, reduction of oxygen uptake capacity by damaging the epithelial cells of the gill, and inhibition of cholinesterase enzyme activity, thus causing serious problems to the nervous system. ACUTE AND SUBLETHAL EFFECTS OF ORGANOTIN COMPOUNDS ON AQUATIC BIOTA: AN INTERPRETATIVE LITERATURE EVALUATION,
Johns Hopkins Univ., Laurel, MD. Applied Physics Lab.
L. W. Hall, and A. E. Pinkney.
Critical Reviews in Toxicology, Vol. 14, No. 2, p 159-209, 1985. 5 Tab, 101 Ref.

Descriptors: *Toxicity, *Water pollution effects, *Reviews, *Organotin compounds, Organic compounds, Metals, Tin, Aquatic life, Zooplankton, Fish, Invertebrates, Phytoplankton, Marine environment, Estuarine environment, Bioaccumulation.

The objectives of this review were to collect, synthesize, and interpret acute and sublethal organotin toxicity data in both freshwater and estuarine-marine ecosystems; to present environmental water column and sediment concentrations of organotin compounds in both freshwater and estuarine-marine systems to facilitate interpretation of toxicity data; and to identify deficiencies in available data to recommend future research for assessing ecological effects of organotin compounds in aquatic systems. Organotin toxicity data were available with 4 phytoplankton species, 5 zooplankton species, 19 species of macroinvertebrates, and 11 fish species. Acute organotin toxicity was found to range from 0.0004 to 0.004 mg/l bis (tributyltin) oxide (TBTO) for several zooplankton species. Acute mortality data for macroinvertebrates ranged from 0.0005 mg/l TBTO for juvenile mysid shrimp, Metamysidopsis elongata, to 0.29 mg/l TBTO for the pacific oyster, Crassostrea gigas. Imposex occurred in the mud snail at TBTO concentrations below the LC50. Bioconcentration-depuration studies with macroinvertebrates were conducted with mud crabs and oysters. Mud crabs exposed to TBTO through both food and water accumulated higher concentrations when compared with exposure through water. The effects of interacting environmental parameters such as temperature and salinity on the toxicity of organotin compounds to macroinvertebrates was also evaluated. Ninety-six hour LC50s for adult estuarine and marine fish ranged fom 0.005 mg/l TBTO for sheepshead minnows to 0.036 mg/l TBTO for the sole. Bioconcentration-depuration studies with sheepshead minnow showed that TBTO did not reach equilibrium in various tissues after 58 days of exposure. Ninety-six hour LC50s for all trophic groups were found to range from 0.0004 to 0.29 mg/l TBTO. Zooplankton were the most sensitive group; bivalves the most resistant. Environmental concentrations of organotin compounds in estuarine and marine water ranged from not detectable to 0.00 mg/l. Higher concentrations of organotin compounds were found in harbor and marina areas. (Baker-IVI)

MORPHOMETRIC ANALYSIS OF THE RESPONSE OF ANABAENA FLOS-AQUAE AND ANABAENA VARIABILIS (CYANOPHYCEAE) TO SELECTED CONCENTRATIONS OF ZINC,
Herbert H. Lehman Coll., Bronx, NY. Dept. of Biological Sciences.
J. W. Rachlin, T. E. Jensen, and B. E. Warkentine.
Archives of Environmental Contamination and Toxicology, Vol. 14, No. 4, p 395-402, July, 1985. 3 Fig, 4 Tab, 31 Ref.

Descriptors: *Anabaena, *Cyanophyta, *Zinc, *Metals, *Toxicity, *Algae, Water pollution effects, Electron microscopy, Plant physiology.

The toxicological responses of the fresh-water cyanophycean algae Anabaena flos-aquae and A. variabilis, to select concentrations of the essential cation zinc, were quantified by the techniques of stereological electron microscopic morphometry. The cation concentrations used were 20.6, 52.0, and 114.7 micro-M, which represented the 96-hr EC50 dose for A. variabilis and an equal bisection of a log scale above and below this concentration. The results indicated that the surface area of the thylakoids of A. flos-aquae were significantly increased after exposure to 114.7 micro-M Zn, and that there was a significant increase in the number of lipid bodies per cell. All test concentrations caused a significant reduction in both the numbers and relative volume of the cell's cyanophycin granules, but resulted in an increase in the cell's membrane limited crystalline inclusions. Both 52.0 and 114.7 micro-M Zn caused a significant increase in the surface area of the thylakoids of A. variabilis, but only the highest concentration caused an increase in the volume of the interthylakoidal spaces. The relative volume and numbers of lipid bodies of A. variabilis cells were increased by exposure to 52.0 micro-M Zn, and 114.7 micro-M Zn caused a significant increase in the relative volume and numbers of the cell's polyphosphate bodies. The significance of these results are discussed in terms of potential cellular detoxification mechanisms, which are important in the cell's ability to cope with the anthropogenic introduction into the aquatic environment of metal and industrial pollutants. The EC50-96-hr value for avoidance
n 0.5 and 0.75 mg/L. With food pro-
n contaminated water, fish exhibited a
and intense attraction period at the lower levels (0.5 to 2.0 mg/L) when compared to dispersed feeding. No significant differences between the feeding regimes existed at the higher copper levels. Mortality curves were similar in both feeding routines. Injured fish were found in the least contaminated waters. Tagging experiments indicate a movement pattern initially toward the toxicant, with subsequent reverse migration to cleaner waters. Little movement occurred during attraction and avoidance stages. Initial avoidance was not observed at any of the tested copper concentrations. Results indicate initial attraction at all concentrations may orientate fish toward the contaminant source, and subsequent avoidance behavior had little effect on survivorship rates. Observed trout behavior subsequent to copper discharges contributed to high mortality; behavioral response of organisms to toxicants must be incorporated into work attempting to set reasonable water-quality standards in natural water bodies. SODIUM IN DRINKING WATER IN SOUTH CAROLINA,
South Carolina State Dept. of Health and Environmental Control, Columbia. Div. of Chronic Disease.
D. T. Lackland, M. C. Weinrich, F. C. Wheeler, and D. M. Shepard.
American Journal of Public Health, Vol. 75, No. 7, p 772-774, July, 1985. 2 Tab, 22 Ref. National Heart, Lung, and Blood Institute contract N01-HV-72987.

Descriptors: *Sodium, *Drinking water, *South Carolina, *Hypertension, Diet, Public health, Chemical composition, Calcium, Minerals, Blood pressure, Water quality.

Because of the reported variability between individuals in the percent of dietary sodium contributed by drinking water, the potential contribution of drinking water sodium to total consumption and to blood pressure levels was explored in a South Carolina population-based survey. The Carolina Health Survey was implemented in 1982 to obtain information on hypertension, health status, and health behaviors of non-institutionalized South Carolinians 18 age or older. For each of the 825 participating households, a 50 ml water sample was taken from the water source used for drinking and cooking purposes; sodium analysis was determined by the flame emission technique. Drinking water consumption was estimated at one liter per day. In the field, interviewers took blood pressure measurements from one adult in each household and administered a diet questionnaire. Most (96 per cent) of the population was served by drinking water containing $<$ 100 mg/l Na (median 14.8 mg/l). For households with water sources containing $>$ or $=$ 100 mg/l Na, drinking water accounted for approximately 8.5 per cent of total estimated consumption. After adjustment for age, sex, race, body mass index, education, and dietary sodium, a negative association between diastolic blood pressure and drinking water sodium levels was found. No significant associations of dietary sodium with either systolic or diastolic BP were found. The linear discriminant analysis to assess drinking water and dietary sodium as identifiers of hypertensives showed no contribution for dietary sodium, but a statistically significant contribution for drinking water sodium ($p<.05$). It is suggested that the observed negative association between systolic and diastolic BPs and drinking water sodium is not simply due to chance but the association is causally improbable; the observed association may result from confounding by other minerals such as calcium. SOLUBILZATION EFFECTS OF SIMULATED ACID RAIN ON THE ORGANIC MATTER OF FOREST SOIL; PRELIMINARY RESULTS,
Queen's Univ., Kingston (Ontario). Dept. of Chemistry.
G. W. Hay, J. H. James, and G. W. vanLoon.
Soil Science, Vol. 139, No. 5, p 422-430, May, 1985. 6 Fig, 3 Tab, 34 Ref. Canada Department of Supplies and Services contract ISU80-00350.

Descriptors: *Acid rain, *Water pollution effects, *Forest soils, *Organic matter, *Solubilization, Chemistry of precipitation, Acidity, Hydrogen ion concentration, Organic carbon, Nitrogen.

The concentrations of total organic carbon, total carbohydrate, fulvic acid, and ammonium-plus-amino nitrogen were determined in leachates from columns of a Canadian shield podzol soil at depths of approximately 10 and 20 cm after treatment with aqueous solutions of pH 5.7, 3.5, and 2.0. Sampling was carried out in the laboratory over a 16-d period during which the soil received a total accumulation of 935 mm of simulated rainfall, equivalent to 1 year's precipitation. Highest concentrations of each of total organic carbon, total carbohydrate, and fulvic acid were obtained after the pH 5.7 treatment; the concentrations were greater at the 10-cm depth than at 20 cm. The pH 2.0 solution dissolved the least amounts of these components. The opposite trend was observed in the analyses of ammonium-plus-amino nitrogen. The soil exhibited considerable buffering action in terms of regulating leachate pH. (Author's abstract)

Arabian crude oil, Libyan crude oil, No. 6 fuel oil and No. 2 fuel oil were applied, in November 1981, to 1 sq m salt marsh plots in Galveston Bay, Texas. Oil treatments were: no oil, 1 liter on sediment, 1.5 liters on sediment and lower 30 cm of Spartina alterniflora and 2 liters on sediment and entire S. alterniflora surfaces. All oils caused death of above-ground parts of plants within 3 weeks when applied to entire plant surfaces. Partial coverage was harmful only with No. 2 fuel oil, while sediment application had no effect. By 5 months, new growth had occurred from roots and rhizomes in Arabian crude oil, Libyan crude oil and No. 6 fuel oil plots and live biomass was near that of controls. By 1 year recovery was complete. For No. 2 fuel oil plots, which sustained the greatest mortality, growth was significantly below control levels at 5 months and 1 year, but recovery was complete within 2 years. Slow recovery in No. 2 fuel oil plots appeared to be due to the initial mortality of below-ground, as well as above-ground, plant parts. Toxicity of residual oil in the sediment did not appear to be a factor in slow recovery since seedling establishment had occurred within 5 months and little residue of No. 2 fuel oil was present in the sediments after 1 year. Also, this residue did not contain alkyl-substituted naphthalenes, toxic components present in the original oil. Considerable residues of all oils except No. 2 fuel oil were present in the sediment after 1 year. Pristane/nC17 and phytane/nC18 ratios indicated that removal of some oil components had occurred through biodegradation. (Author's abstract)

IMPACT OF LAND-APPLIED INCINERATOR ASH RESIDUE ON A FRESHWATER WETLAND PLANT COMMUNITY,
Massachusetts Univ., Waltham. Suburban Experiment Station.

J. S. Mika, K. A. Frost, W. A. Feder, and C. J. Puccia.
Environmental Pollution (Series A), Vol. 38, No. 4, p 339-360. 1985. 6 Fig, 3 Tab, 24 Ref.

Descriptors: *Ash, *Land disposal, *Wetlands, *Vegetation, Species abundance, Species diversity, Environmental effects, Phytotoxicity, Groundwater pollution, Landfills.

In 1977, 60-70 tons of incinerator ash residue were deposited adjacent to a freshwater wetland. These residues are known to contain elevated concentrations of soluble cations and toxic elements. The impact on the wetland plant community was monitored over a 6-year period. Changes in species abundance and diversity were assessed both over time and distance from the residue deposition. A methodology from the marine benthic pollution literature as used to identify possible indicator species from the group of moderately adapted plants. Distance from the residue did not account for the overall increase in community richness, but appeared to be a factor in the increased relative abundance of moderately adapted species near the residue site, as a result of decreased relative abundance of dominant species. Acute phytotoxic effects were undetected, with the possible exception of the decline of Asclepia syriaca (milkweed). Post-experiment soil analyses indicated an increase of Ca, Mn, P, Zn and Cd in wetlands soils near the residue site and an even greater increase in P, K, Ca, Mg, B, Zn, Cu, Mn, Al, Cd, and Pb in the soil directly beneath the residue. If residue landfills are not properly designed or maintained, the cumulative impact of daily residue deposition could eventually disrupt sensitive ecosystems and pollute adjacent soils and groundwater. Descriptors: *Epidemiology, *Public health, *Drinking water, *Gastroenteritis, *Alberta, Water treatment, Monitoring, Wastewater pollution, Water pollution effects, Water quality control.

In February 1983, an epidemic of gastroenteritis affecting approximately 3000 persons occurred in a city of 6500 in Alberta. The onset of 78% of the cases was within a four day period. Vomiting was a sympton in 52% of the cases and diarrhea in 60%. Duration of illness was 24 to 48 hours. Median incubation period was 38 hours. Stool cultures form affected persons were negative for bacterial pathogens. Search for a viral agent has so far been unrevealing. Illness was associated with consumption of water from the municipal system. The execution and monitoring of water treatment were faulty. The source of water in that system is a river whose pollution was augmented just before the epidemic by a discharge of raw sewage from a lift station of the municipal sewage collection system. A chain of causation in a gastrointestinal epidemic is illustrated, against which legislation for protection exists in the Clean Water Act. Those carrying out the treatment of the water and the protection of the river and even those charged under the Act with monitoring and enforcing these functions had a weak appreciation of their significance to Public Health. Descriptors: *Suspended solids, *Plant growth, Light penetration, Water pollution effects, Plant reproduction.

Lemanea was exposed to a range of concentrations of suspended solids and settled material covering the substrate. Coal dust was used as a source of suspended solids. In addition to the laboratory experiments, a field experiment involving the transplant of mature plants of Lemanea from a site with low suspended solids and little pollution to a site downstream where the suspended solids were high. Reduction in light intensity from turbid conditions of suspended solids (5,000 mg/l) reduced primary production in both the chantransia-stage and adult plants. The deposition of a thick layer of silt prevented fixation and colonization of the substrate by carpospores. (Baker-IVI)

EFFECTS OF A CRUDE OIL SPILL ON WATER QUALITY AND MACROBENTHOS OF A SOUTHEAST TEXAS STREAM,
Lamar Univ., Beaumont, TX. Dept. of Biology.
R. C. Harrel.
Hydrobiologia, Vol. 124, No. 3, p 223-228, May, 1985. 1 Fig, 2 Tab, 23 Ref.

Descriptors: *Oil spills, *Water pollution effects, *Stream pollution, *Benthos, *Texas, Water quality, Oil pollution, Dissolved oxygen, Carbon dioxide, Invertebrates, Species diversity, Oligochaetes, Midges, Streamflow, Water temperature.

On December 6, 1981 a crude oil spill of 160 barrels (25,440 liters) occurred in a small southeast Texas stream. On December 8 a boom was placed across the mouth of the stream, and organized cleanup began December 12. During the cleanup, some oil was manually pushed down into the steam sediments. Water quality changes, other than the presence of oil, were not evident until six months later when water temperature increased and stream flow ceased. A thick film of oil and plant detritus covered the surface of the stream. This resulted in decreased dissolved oxygen and increased carbon dioxide concentrations. Responses of the benthic macroinvertebrate community included an increase in density of oligochaetes, decrease in numbers and taxa of chironomids, with eventual complete elimination, and low community diversity. Decrease in oil concentration resulted in reversal of these responses. Eleven months after the spill, stream flow had resumed and water temperature decrease, but oxygen concentrations remained low. No clean water taxa were collected and complete recovery had not occurred 26 months after the spill when the study was terminated. All taxa were tolerant or facultative to organic pollution. Descriptors: *Water pollution effects, *Algae, *Monitoring, *Tumen River, Scenedesmus, Bioassay, Industrial wastewater, Bioindicators, Periphyton, Photosynthesis.

Studies on attached algae communities, collected from artificial substrates, were made in upper and middle reaches of Tumen River in 1977-1979. Bioassay using Scenedesmus for some effluents was carried out in laboratory. Based on results obtained, an evaluation of water pollution in the River was made. The upper reach, represented by station Chongshan, is evaluated as an unpolluted area. The middle reach, from the drainage o ore mining effluents downwards to station grenping, is a heavily to moderately pollute From station Caidui, where the River recei pulp mill effluent, to city Tumen, the river w most heavily polluted. The stretch of Riv tween station Hedung and the pollution sou brown-coal chemical industry in the lower r considered as slightly to moderately pollute assay test also show that pulp mill effluent is the main pollution sources of River Tume acute ILm of Scenedesmus to the main effluent of the pulp mill is about 45% (v/v most toxic is the sulfite waste liquor. The h effect on algae growth by iron-ore mining o is caused by the large amount of suspended contained in this effluent, which reduces ph thetic activity of algae. This effluent must b sidered as another main pollution source river. Discussing and comparing the results phyton studies in Tumen River, the autho pose some algological indices for monitori evaluating pollution conditions in this Among them the total count of attached a the most suitable and is expressed as a com relative value. Some indicator algae spec presented. The application of diversity ind discussed. (Author's abstract)

The objective of this study was to det through a screening survey whether 2,3 trachlorodibenzo-p-dioxin (TCDD) was pre six Massachusetts water bodies that have h of treatments with herbicides (Silvex, Ku 2,4,5-T) that contain 2,3,7,8-TCDD as a co nant formed during the manufacturing p The water bodies studied were Lake Wi Boons Pond, North Pond, and Nonesuch (Middlesex County), Flint Pond (Wo County), and Stockbridge Bowl (Lake Mahk (Berkshire County). Five of the six sedimen ples analyzed did not meet the analytic crite positive identification of the dioxin. De limits ranged from 3.0 ppt to 5.5 ppt. Lak throp did meet the criteria for positive ide tion and the sediment had a 2,3,7,8-TCDD c tration of 5.9 ppt. The survey confirmed th ence of 2,3,7,8-TCDD in one pond with a se sample containing 5.9 ppt 2,3,7,8-TCDD an sample (bullhead - Ictalurus sp.) containing of 2,3,7,8-TCDD. Age analysis suggests t fish have had at least 2.5 years of exposure respective lakes with a study-wide average years. Lake Winthrop appears to have been very little over the years compared to the lakes studied. The fish flesh concentration e the U.S. Food and Drug Administration gu of 50 ppt in fish flesh for human consumptio five archived bullheads from Lake Winthro retested and nets were set in the lake to c more specimens. Yellow perch and pickere mens had no detectable levels of 2,3,7,8-

one of the bullheads had a detectable level of -TCDD; in two tests the concentration was ined to be 19 and 25 ppt. The high detection in the other samples present a problem since -TCDD could possibly be present below imits. (Collier-IVI)

DIETARY DOSE AND BURDENS IN BASS FROM THE HUDSON RIVER,
rk Univ. Medical Center, Tuxedo Park. nvironmental Studies.
'onnor.
ern Environmental Science, Vol. 3, No 52-158. 4 Tab, 30 Ref. NIEHS grant

rs: *Polychlorinated biphenyls, *Bass, ues, *Hudson River, *New York, *Water effects, Fish diets, Chlorinated hydrocar-nmarus, Amphipods.

orting the hypothesis that polychlorinat-yl (PCB) body burdens in fish are related ly dietary dose, as modified by the meta-esses of assimilation, tissue retention and n have been based exclusively on labora-es. As a field verification of this hypothe-s of striped bass, and their stomach con-tents, were analyzed for PCBs in order to determine relationships between PCB concentration in the food and PCB burdens in the fish. Samples of striped bass were collected from the New York Harbor region (the Hudson River at Weehawken, NJ (WHK) and between piers at Canal Street in Manhattan, NY (CST)) during the winter of 1983. The majority of food organisms observed in striped bass stomachs were benthic and epibenthic crustacea, primarily Gammaridean amphipods. Total body burden of PCB in young striped bass was calculated as the concentration of PCB in the flesh times the dry-weight of the specimen with the dry-weight concentration in the flesh assumed to be the same as the dry-weight concentration in most of the tissues and organs. Due to the greater concentration of PCB in striped bass from CST, PCB burdens (mean = 67.6 micro-g total PCB) were greater than in the bass from WHK (mean = 25.7 micro-g). Stomach contents from striped bass taken at WHK contained a mean of 2.3 micro-g/g total PCB, while the PCB concentrations of stomach contents from fish taken at CST were 6.15 micro-g/g. At the CST station, PCB concentrations in the food were greater than in the flesh of the fish. At the WHK station the PCB concentrations in the food and in the fish were similar. The ratio of mean PCB concentrations in stomach contents to that of the flesh was similar at the two stations (0.70 at WHK and 0.71 at CST). The results provide paired dose/burden data useful in refining mathematical models for predicting the accumulation of PCB and other xenobiotics in fish, based upon empirical data rather than rough estimates of exposure parameters. ORIGIN OF HIGH CADMIUM CONCENTRATIONS IN HUDSON RIVER BLUE CRAB (CALLINECTES SAPIDUS RATHBUN),
New York State Dept. of Environmental Conservation, Albany. Bureau of Environmental Protection.
R. Sloan, and R. Karcher.
Northeastern Environmental Science, Vol. 3, No. 3/4, p 221-231. 4 Fig, 4 Tab, 37 Ref.

Descriptors: *Cadmium, *Animal tissues, *Crab, *New York, *Hudson River, *Flushing Bay, *Long Island Sound, Heavy metals, Metals, Water pollution effects, Source of pollutants, Mercury, Public health.

In 1979, due to high cadmium concentrations in blue crab, Callinectes sapidus, the New York State Health Department warned against consuming the hepatopancreas and to restrict leg meat consumption to one meal per week, based on a limited Hudson River summer sampling. A lack of data from other localities led to collections in 1981 from 11 locations in New York marine waters, including 6 Hudson river, 1 Staten Island and 4 Long Island sites. Muscle and hepatopancreas tissues were analyzed for cadmium utilizing atomic absorption spectrophotometric techniques. Although female sample sizes were small in areas of high contamination, they tended to have greater cadmium concentrations than males by factors of 1.5 to 2. Regardless of sex, the six Hudson River locations produced average concentrations of 0.24 ppm (N = 55) and 7.86 ppm (N = 60) for the leg muscle and hepatopancreas, respectively, compared to average values for similar tissues from other areas (excluding Flushing Bay) of 0.09 ppm (N = 25) and 0.72 ppm (N = 25). Cadmium concentrations were two to five times higher in thoracic muscle than leg muscle (N = 8). Flushing Bay crabs had higher hepatopancreas levels (-x = 3.84 ppm; N = 8) than other Long Island crabs indicating a potential cadmium source. Overall, the bulk of cadmium contamination appears to originate in the Hudson River. Limited numbers of mercury analyses reflected relatively low concentrations with respect to the USFDA action level of 1 ppm. Lobsters (Homarus americanus) from western Long Island Sound were suprisingly high in cadmium, and the few analyzed (N = 10) indicate a need for additional study of this species. (Author's abstract)

RESPONSE OF INVERTEBRATES IN TEMPORARY VERNAL WETLANDS TO ALTOSID SR-10 AS USED IN MOSQUITO ABATEMENT PROGRAMS,
Minnesota Dept. of Natural Resources, St. Paul.
R. W. Lawrenz.
Journal of the Minnesota Academy of Science, Vol. 50, No. 3, p 31-34, 1984/85. 2 Fig, 5 Ref.

Descriptors: *Mosquitos, *Invertebrates, *Wetlands, *Insecticides, *Ecological effects, Water pollution effects, Pesticides, Toxicity, Hormones.

Three temporary vernal wetlands on the Bayport Wildlife Management Area in eastern Washington County, Minnesota, were divided by sandbag barrier into treatment and control areas. Designated areas were treated with Altosid SR-10 briquets at standard mosquito control rates. Invertebrate populations were monitored weekly using net sweeps, column samples, and ocular estimates. The development of Eubranchipus bundyi, Lyncerus sp, and Daphnia sp., the three major components of the invertebrate fauna, was delayed by as much as one week in site 47. Similar development lags were noted for E. bundyi populations in the treated portions of sites 6 and 32. Delay of maturation was expressed in greater longevity and higher male to female sex ratios for treated populations of E. bundyi. Daphnia sp. population growth was also retarded by treatment, with a concurrent lag in ephippium (resting egg) formation. Delay in the development or sexual maturity of vernal faunas could impact those faunas and the wildlife that are dependent on them as seasonal dietary protein resources. (Author's abstract)

IDENTIFYING POLLUTION RELATED CHANGES IN CHIRONOMID COMMUNITIES AS A FUNCTION OF TAXONOMIC RANK,
Oak Ridge National Lab., TN. Environmental Sciences Div.
J. C. Waterhouse, and M. P. Farrell.
Canadian Journal of Fisheries and Aquatic Sciences, Vol. 42, No. 3, p 406-413, March, 1985. 2 Fig, 3 Tab, 21 Ref. EPA grant R805193-02-2 and DOE contract DE-AC05-840R21400.

Descriptors: *Water pollution effects, *Midges, *Taxonomy, Heavy metals, Metals, Zinc, Copper, Chromium, Invertebrates, Presence/absence data, Ecological effects.

Specific- and generic-level analyses of chironomid presence/absence data were compared along a heavy-metal gradient. Eighteen binary similarity coefficients were calculated for five sampling stations from a small Ohio stream that receives an effluent containing zinc, copper, and chromium from a metal-plating industry. In general, the specific- and generic-level values were highly correlated and showed similar patterns across the 10 station comparisons. The basis for this correlation was then investigated by an assessment of both the amount (average number of species per genus) and the pattern (species to genus ratio trend) of information loss along the pollution gradient. Trends in the species to genus ratio along the gradient are viewed as indicative of the similarity of congenerics in their response to the gradient. The lack of a significant trend in the species to genus ratio in our data indicates that the agreement between specific- and generic-level analyses was due to the ability of a robust species distribution pattern to withstand a limited amount of random information loss, rather than any inherent similarity among congenerics reflected in their species to genus ratio trends. Analyses based on only a few species (e.g. abundant or indicator species) cannot afford as much information loss and must rely more heavily on similarity of congeneric species. (Author's abstract)

Canadian Journal of Fisheries and Aquatic Sciences, Vol. 42, No. 3, p 455-458, March, 1985. 2 Fig, 2 Tab, 23 Ref.

Descriptors: *Bioindicators, *Fisheries, *Eels, *Saint Lawrence River, *Ontario, *Quebec, *Lake Ontario, *Mirex, Pesticides, Chlorinated hydrocarbons, Path of pollutants, Water pollution effects, Fish, Water quality.

Mirex concentrations were measured in eels (Anguilla rostrata) from eastern Canada to determine the contribution of Lake Ontario eels to the Saint Lawrence commercial fishery. Mirex could be detected in all eels (50 specimens) collected in Lake Ontario (0.18 + or - 0.11 micro-g/g). Most sedentary eels collected from the Saint Lawrence commercial fishery and both the migratory and sedentary eels collected from the Saint Lawrence tributaries and the Maritimes had no mirex. Of the migrating eels collected in the Saint Lawrence 74% contained mirex (0.17 + or - 0.19 micro-g/g). These results show that stocks can be discriminated on the basis of the presence of synthetic chemical products such as pesticides and other contaminants that are distributed heterogeneously in the environment. Based on a presence-absence criterion, this method for stock discrimination has the distinct advantage that it is more accurate and less time consuming than similar methods based on the presence of natural chemical products. RESULTS OF OHIO RIVER MACROINVERTEBRATE SAMPLING FOR 1975-1981,
West Virginia Dept. of Natural Resources, Charleston. Div. of Water Resources.
J. E. Fisher, and L. E. McCoy.
Proceedings of the West Virginia Academy of Sciences, Vol. 55, No. 2/3/4, p 42-55, 1983. 9 Fig, 7 Ref.

Descriptors: *Ohio River, *Macroinvertebrates, *Species diversity, *Rivers, Water pollution effects, Species composition.

The results of macroinvertebrate sampling from nine stations along the Ohio River are presented. Comparisons of Brillouin diversity, numbers of individuals, and taxa present for each site indicated significant improvements in the biological communities for two sites, Weirton and Hannibal. Only one site, Keyger Creek, was significantly poorer over time. Most other stations appeared to have made some improvement or remained unchanged, with the notable exceptions, however, of Willow Island and Belleville. These stations appeared to have been adversely impacted by some factor or combination of factors. The Belleville site had shown continued improvement from 1975 through 1980. However, the 1981 sample revealed a significant drop in diversity. (Author's abstract)

ASSOCIATIONS OF CANCER MORTALITY RATES AND EXOGENOUS ENVIRONMENTAL FACTORS IN WEST VIRGINIA,
West Virginia Univ., Morgantown. Dept. of Anatomy.
P. Baciu, E. C. Keller, and J. D. Tucker.
Proceedings of the West Virginia Academy of Science, Vol. 55, No. 2/3/4, p 82-91, 1983. 4 Tab, 6 Ref.

Descriptors: *Cancer, *West Virginia, *Water pollution effects, *Public health, Epidemiology, Alkalinity, Acidity, Zinc, Dissolved oxygen, Phosphate, Manganese, Water quality.

Correlation analyses were completed on West Virginia county data for cancer mortality rates and on county geological, water quality, and coal production variables. The individual cancer mortality variables most frequently observed to be in association with environmental variables were: mouth, pancreas, and rectal cancers in males, and nasal, lip, and stomach cancers in females. The environmental variables most frequently associated with these cancer were: (1) levels of alkalinity, water flow, acidity, zinc, dissolved oxygen, phosphate, and manganese found in the natural waters of the various counties; (2) levels of particulates, hydrocarbons, and nitrous oxides in the air; (3) the percentage of the county underlain by brine, medium bituminous coals, and three types of limestones; and (4) to a minor degree, the number of sand quarries in the county. An 'acid mine drainage' environmental factor as defined by factor analysis was highly associated with two cancer mortality groupings viz., 'male digestive' and 'female upper digestive' cancers. Two other water factors 'alkalinity' and 'zinc' were also strongly associated with the 'male digestive' cancer factor. The environmental factors are likely to be, at least in part, surrogates for other populational or occupational aspects of the demography such as urban-industrialized and rural-coal-producing areas. LOW PH TOLERANCE UNDER CONTINUOUS-FLOW BIOASSAY CONDITIONS OF HELLGRAMMITE LARVAE, CORYDALUS CORNUTUS L. (MEGALOPTERA: CORYDALIDAE),
Marshall Univ., Huntington, WV. Dept. of Biological Sciences.
D. C. Tarter, L. O. Hartsock, S. I. McBride, and M. F. Sheridan.
Proceedings of the West Virginia Academy of Science, Vol. 55, No. 2/3/4, p 131-135, 1983. 1 Fig, 1 Tab, 16 Ref.

Descriptors: *Acidity, *Hydrogen ion concentration, *Toxicity, *Helgrammites, *Corydalidae, *Macroinvertebrates, *Bioassays, Water pollution effects, Acid mine drainage, Aquatic insects, Larvae.

Bituminous coal mining produces an acid drainage effluent that is generally recognized as the most widespread pollution problem in the Ohio River Basin. Hellgrammite larvae, Corydalus cornutus L., were experimentally tested under continuous-flow bioassay conditions to determine their tolerance to low pH. The straight-line graphical interpolation method was employed to determine the pH value at which 50 percent of the hellgrammites survived after 96 hours. The 96 hr median tolerance limit pH value was 1.76. Based on the hellgrammite larval continous-flow bioassay experiments and other laboratory and field studies of aquatic insects, the order Megaloptera can be considered the group of aquatic insects most tolerant to low pH conditions. The toxic mode of action of acid mine drainage on benthic macroinvertebrates has received some attention in the literature. Several mechanisms may be involved in the toxic mode of action of acid mine water on aquatic insect larvae. Apparently, larval megalopterans are able to survive in higher concentrations of mine drainage than most aquatic insects becau some well-adapted physiological response to extreme environmental conditions. INVESTIGATION INTO THE OCCURR OF SEWAGE FUNGUS IN RIVERS CONT ING PAPERMILL EFFLUENTS - I; RE OF PREVIOUS RESEARCH,
Pira, Leatherhead (England). Paper and Div.
L. J. Webb.
Water Research, Vol. 19, No. 8, p 947-954, Tab, 22 Ref.

Descriptors: *Pulp wastes, *Wastewater poll *Microorganisms, *Reviews, Pulp and pap dustry, Water pollution effects, Biol wastewater treatment, Sugars, Fatty acids, hols.

erm 'sewage fungus' denotes the variable unity of microorganisms which form volumi- cottonwool-like growths on river beds suitable physical characteristics. A brief is given of the published literature on e fungus growth from pulp and paper mill rges up to 1978. Previously unpublished ndertaken over the period 1965-1975 is de- . By 1978, it seemed clear that sewage from pulp and paper industry effluents was by the presence of low molecular weight s, a mixture of sugars, volatile fatty acids ohols in the case of pulping wastewaters arch-derived sugars in paper/board mill aters. Intermittent discharge was a proven ue for controlling sewage fungus growth ulp mill effluents. While biological treat- f papermill discharges could achieve high emoval, the inherent variability in the per- e of biological plants precluded the com- imination of sewage fungus growth poten- en the dilution available was only of the f 10- to 20-fold. e fourth and final paper in a series of scribing research undertaken at PIRA 8-1980 on the causes and prevention of ngus growth in rivers receiving paper mill effluents. This paper describes simu- am studies in which sewage fungus growths from mixed mill effluents, component effluent streams and mill raw materials were quantified at two paper-mill sites. At the first mill, sewage fungus growth from treated effluent was only light and somewhat less than might have been expected from the measured level of glucose. Cationic starch was a better nutrient than unmodified starch and possible reasons for this are put forward. Individual waste streams at the second mill supported heavy growths of sewage fungus comparable to that from the mixed mill effluent after clarification. As sole sources of organic carbon, fresh or degraded gelatin and melamine formaldehyde resin gave very little sewage fungus growth, but glycerol supported some growth. As the effluent from this mill was considerably more complex than others previously examined, it was concluded that sewage fungus nutrients were provided by degraded organics (largely unidentified) extracted from rags and broke. EVALUATION OF MATHEMATICAL MODELS FOR THE EFFECTS OF PH AND TEMPERATURE ON AMMONIA TOXICITY TO AQUATIC ORGANISMS,
College of Saint Scholastica, Duluth, MN. Dept. of Chemistry.
R. J. Erickson.
Water Research, Vol. 19, No. 8, p 1047-1058, 1985. 2 Fig, 4 Tab, 31 Ref.

Descriptors: *Mathematical models, *Hydrogen ion concentration, *Temperature, *Ammonia, *Toxicity, Aquatic animals, Gills, Fish.

Available data on the pH and temperature dependence of ammonia toxicity to aquatic organisms were examined and their agreement with various models was evaluated. A model which considers alteration of the relative concentration of un-ionized ammonia at the gill surface failed to adequately describe either pH or temperature dependence. A model that assumes that un-ionized ammonia and ammonium ion are jointly toxic was strongly supported by the data on pH dependence, but could not explain observed temperature dependence. Temperature dependence can be described empirically by a simple log-linear model. The effects of pH and temperature were generally found to be qualitatively and quantitatively similar among fish species. (Author's abstract)

ORGANOCHLORINE PESTICIDES AND POLYCHLORINATED BIPHENYLS IN SEDIMENT AND FISH FROM WETLANDS IN THE NORTH CENTRAL UNITED STATES,
Columbia National Fisheries Research Lab., Yankton, SD. Field Research Station.
D. B. Martin, and W. A. Hartman.
Journal of the Association of Official Analytical Chemists, Vol. 68, No. 4, p 712-717, July/August, 1985. 1 Fig, 5 Tab, 17 Ref.

Descriptors: *Pesticides, *Chlorinated hydrocarbons, *Polychlorinated biphenyls, *Wetlands, *Sediment contamination, *Fish, Pesticide residues, DDD, DDT, Dieldrin, BHC, Trans-nonachlor, DDE.

Sediments samples collected in 1980-1982 from riverine and pothole wetlands at 17 locations in the north central United States were analyzed for organochlorine pesticides, certain of their metabolites, and polychlorinated biphenyls (PCBs). Concentrations were above minimum detection levels (5 ng/g of organochlorines and 20 ng/g of PCBs) in less than 4% of the samples taken. Fish samples taken at 9 of these 17 locations, and analyzed for the same compounds, showed a higher frequency of detectable contaminants. The most common compound found in fish was DDE, which was found in 51% of the samples at levels up to 512 ng/g. Alpha-BHC was present at concentrations of 5 to 27 ng/g in 36% of the fish samples, and DDD was found at levels of 5 to 60 ng/g in 14%. Four other compounds, DDT dieldrin, PCB, and trans-nonachlor, were detected in fish at relatively low concentrations in less than 10% of the samples. This survey, thus, indicated little contamination by organochlorine pesticides or PCBs in the wetland habitats of this region. (Author's abstract)

ALUMINUM MOBILIZATION IN AN ACIDIC HEADWATER STREAM: TEMPORAL VARIATION AND MINERAL DISSOLUTION DISEQUILIBRIA,
Cornell Univ., Ithaca, NY. Dept. of Environmental Engineering.
R. P. Hooper, and C. A. Shoemaker.
Science, Vol. 229, No. 4712, p 463-465, August, 1985. 2 Fig, 1 Tab, 8 Ref.

Descriptors: *Aluminum, *Water pollution effects, *Acid rain, *Acidity, *Streams, *Hubbard Brook Experimental Forest, *New Hampshire, Geochemistry, Metals, Hydrogen ion concentration, Seasonal variation, Snowmelt.

As part of an integrated field and modeling study an extensive sampling effort was undertaken on an instrumented watershed at the Hubbard Brook Experimental Forest (New Hampshire) to examine the chemical response of a stream to snowmelt and storm events during the spring of 1984. Intensive sampling was performed along an elevational gradient in the headwater stream to observe the chemical response of the stream to acidic inputs. Aluminum concentrations during this period were not in equilibrium with a readily formed mineral phase, as has been assumed, and the increase in aluminum concentration due to episodic depressions in pH lessened during the snowmelt. The temporal variation in the aluminum response to pH depressions indicates a more complicated aluminum mobilization mechanism than a mineral dissolution equilibrium. This temporal variation may be caused by the depletion of a slowly forming, labile pool of aluminum in the soil. The high aluminum concentrations may be influenced by a kinetic constraint in the precipitation of an aluminum mineral. Since the sampling focused on high flow events, the higher aluminum concentrations at the higher pH's found downstream could have been due to transport of aluminum that did not have time to precipitate out of solution. The observed disequilibrium between aluminum concentrations in stream water and a readily formed Al(OH)3 mineral phase reduce confidence in predictions of short-term temporal changes in stream chemistry made by investigators using models based on an equilibrium. The temporal pattern of the snowmelt is important in the mobilization of aluminum. The highest aluminum concentrations were observed in the mid-winter thaw, not during the main spring melt. Because sensitive life stages of fish species are present only at certain times of the year, such patterns are important in the assessment of the biological impacts of acid precipitation. BEHAVIORAL MODIFICATION OF ESTUARINE FISH EXPOSED TO SULFUR DIOXIDE,
Johns Hopkins Univ., Shady Side, MD. Aquatic Ecology Section.
L. W. Hall, D. T. Burton, W. C. Graves, and S. L. Margrey.
Journal of Toxicology and Environmental Health, Vol. 13, No 4-6, p 969-978, 1984. 2 Fig, 3 Tab, 24 Ref.

Descriptors: *Animal behavior, *Sulfur dioxide, *Fish behavior, *Water pollution effects, *Sulfites, Bass, Menhaden, Water temperature, Avoidance response, Model studies.

This study was designed to determine the avoidance responses of juvenile striped bass (Morone saxatilis) and Atlantic menhaden (Brevoortia tyrannus) exposed to sulfur dioxide (sulfite) at acclimation temperatures of 15, 20, 25, and 30 C. Predictive models were developed and compared for each species at each acclimation temperature. Striped bass avoided 2.2, 2.3, 3.0, and 3.5 mg sulfite/l at 15, 20, 25, and 30 C, respectively. Atlantic menhaden avoided 3.2, 3.6, 2.9, and 3.0 mg sulfite/l at acclimation temperatures of 15, 20, 25, and 30 C, respectively. Acclimation tempera-

ture was an important factor influencing the avoidance response of each species exposed to sulfur dioxide. Striped bass avoided lower concentrations of sulfite than Atlantic menhaden at 15 and 20 C. Both species avoided approximately the same concentration of sulfite at 25 C. Atlantic menhaden avoided lower concentrations of sulfur dioxide than striped bass at 30 C. (Author's abstract)

Journal of Plankton Research, Vol. 7, No. 4, p 461-471, 1985. 2 Fig, 4 Tab, 22 NSF grant F7FO22Y and Smithsonian Institution grant JF-10-SMI.

Descriptors: *Protozoa, *Invertebrates, *Eutrophication, *Po River, *Adriatic Sea, Water pollution effects, Zooplankton, Mixing, Stratification, Seasonal variation, Abundance, Distribution.

The ciliated protozoans and micrometazoans in the northern Adriatic were repeatedly sampled and analyzed during summer and winter periods, with emphasis on quantifying the changes in abundance, and community structure, associated with a trophic gradient created by the discharge of the Po River. The community was characterized by major groups, organism abundance and volume, and size class frequency. The microzooplankton biomass increased 2- to 3-fold toward the western side of the Adriatic off the Po delta, during both 'mixed' and 'stratified' seasons, with increases in both the ciliated protozoans and micrometazoan components. At eutrophic sites and under 'stratified ' conditions a marked increase in the relative abundance of ciliated protozoans was observed, with a relative increase in tintinnid contribution to the total ciliated protozoan biomass. Although marked changes in the ciliated protozoan biomass occurred, little change in their size class structure occurred except as influenced by inflowing waters from the central Adriatic. ABUNDANCE OF WEST INDIAN MANATEES (TRICHECHUS MANATUS) AROUND SELECTED FLORIDA POWER PLANTS FOLLOWING WINTER COLD FRONTS, 1982-1983,
Eckerd Coll., St. Petersburg, FL. Dept. of Biology.
J. E. Reynolds, and J. R. Wilcox.
Bulletin of Marine Science, Vol. 36, No. 3, p 413-422, 1985. 1 Fig, 4 Tab, 21 Ref.

Descriptors: *Manatees, *Powerplants, *Water temperature, *Florida, Air temperature, Behavior, Thermal pollution, Abundance.

Seven 1-day aerial surveys were flown during winter, 1982-1983, to assess manatee abundance. The surveys focussed on five Florida Power and Light Company plants: Cape Canaveral (PCC), Riviera (PRV), Port Everglades (PPE), Lauderdale (PFL), and Ft. Myers (PFM). Of the 1,191 manatees sighted during the surveys, 930 were present in the immediate vicinity of the plants. Ten percent of the total animals sighted were calves, with the highest percentage of calves (13.6%) being present at PFM. Maximum counts of manatees for each plant were as follows: PCC, 15; PRV, 98; PPE, 56; PFL, 16; PFM, 85. With the exception of PRV's maximum count, of the 1982-1983 maxima represent the lowest maximum counts for the respective plants in 6 years of surveys. The low counts most likely reflect the mild winter temperatures. With the exception of PFM, there is no indication that any regional manatee populations have declined significantly. Seventeen regressions compared the following variables: intake water temperature at power plants, mean daily air temperature, and number of manatees observed at each plant. Significant correlations were found only for three regressions of water temperature and number of manatees, for one regression of air temperature and number of manatees, and for one regression of all variables. The remaining regressions indicated correlations that were not significant, supporting the contention that winter cold was not of sufficient intensity or duration in 1982-1983 to cause large numbers of manatees to aggregate. INVESTIGATION OF A EUTROPHIC TIDAL BASIN: PART 2 - NUTRIENTS AND ENVIRONMENTAL ASPECTS,
Southern Water Authority, Otterbourne (England). Resources Planning Lab.
H. A. C. Montgomery, P. G. Soulsby, I. C. Hart, and S. L. Wright.
Marine Environmental Research, Vol. 15, p 285-302, 1985. 1 Fig, 4 Tab, 18 Ref.

Descriptors: *Eutrophication, *Tidal basins, *Nutrients, Wastewater pollution, Water pollution sources, Sediments, Phosphorus, Nitrogen, Cycling nutrients, Algal growth.

The eutrophication of Langstone Harbour, a large tidal basin, has been studied by statistically designed nutrient surveys. Rates of input of nutrients from the sea, from effluent discharges and from other sources, have been estimated. Sediment/water interactions have been shown to be important in the phosphate budget of the basin, but they are less important in the nitrogen budget. Deductions were made about the relative importance of the various inputs and processes affecting concentrations of nutrients in the water column. It is concluded that ecologically or aesthetically detrimental growths of macroalgae are unlikely to occur in Langstone Harbour in the foreseeable future and that the removal of nutrient inputs, formerly thought to be necessary, will not, in fact, be required. The principles of the experimental design and of interpreting the data are of general applicability to tidal waters where the ratio of natural to man-made inputs needs to be known, where eutrophication is, or is expected to become, a problem, or where the progressive accumulation of nutrients by recycling is suspected. *Dredging, *Dumping, *Ecological int John Harbor, *New Brunswick, ater pollution effects, Species compo- haetes.

poverished communities of benthic a in Saint John Harbor, three were attributable to anthropogenic causes: disposal of solid wood wastes, dredging, and dumping activity. Circumstantial evidence indicates that the fourth community resulted from strong tidal currents present in the inner harbor interacting with the sediment causing periodic erosion and deposition, resulting in an impoverished macro-infauna. The dredged area was rapidly recolonized; first by invasive species such as Capitella capitata and Nereis sp. and then by species present in adjacent sediments. The area adversely affected by dumping was of limited extent: of the order of 1 sq km, as indicated by the presence of exotic species in dump soil and the distribution of organic carbon. CHLORINATED HYDROCARBONS AND HATCHING SUCCESS IN BALTIC HERRING SPRING SPAWNERS,
Bundesgesundheitsamt, Berlin (Germany, F.R.). Inst. fuer Wasser-, Boden- und Lufthygiene.
P. D. Hansen, H. von Westernhagen, and H. Rosenthal.
Marine Environmental Research, Vol. 15, p 59-76, 1985. 2 Fig, 2 Tab, 21 Ref.

Descriptors: *Chlorinated hydrocarbons, *Herring, *Fish, *Water pollution effects, *Spawning, *Hatching, Toxicity, Polychlorinated biphenyls, DDD, DDE, Pesticides, Growth stages.

Eggs from 69 females of spring spawning herring from the German Baltic coast (Travemunde, April 1979) were incubated in clean sea water (20 0/00 S, temperature 8 C) under standard conditions. Sixty-one trials could be used for the evaluation of hatching success. Viable hatch was taken as a measure to evaluate the effects of chlorinated hydrocarbons accumulated in gonads, liver and muscle of parental fish. PCB levels in running ripe females ranged on a wet weight basis between 19 and 241 ng/g (gonad), 20 and 377 ng/g (liver) and 11 and 1820 ng/g (muscle). Concentrations of other chlorinated hydrocarbons (DDD, DDE, gamma-HCH, etc.) were in the same range as reported by other authors for Baltic herring. Viable hatch was significantly affected at ovary DDE concentrations higher than 18 ng/g (wet wt) and PCB concentrations of more than 120 ng/g (wet wt). (Author's abstract)

STUDY OF THE TOXICITY OF SOME SILICONE COMPOUNDS IN RELATION TO MARINE BIOLOGICAL CHAINS,
Centre d'Etudes et de Recherches de Biologie et d'Oceanographie Medicale, Nice (France).
M. Aubert, J. Aubert, H. Augier, and C. Guillemaut.
Chemosphere, Vol. 14, No. 1, p 127-138, 1985. 10 Fig.

Descriptors: *Toxicity, *Silicone compounds, *Marine environment, *Food chains, Organosilicone compounds, Fish, Crustaceans, Mollusks, Bioaccumulation, Phytoplankton, Water pollution effects.

The trophic chain method developed in the laboratory is intended to reconstruct simplified but characteristic ecosystems and thus to provide a predictive method of studying the effects of chemical pollution on the various links in marine trophodynamic chains. The trophodynamic chain method was used in a study of the toxicity of organosilicone compounds and their emulsifier to marine biological chains. The trophodynamic chains studied include a fish benthic chain, a crustacean benthic chain, a mollusk chain and a pelagic chain. The accumulation factors are generally very low (from 0.036 to 2.08). The transfer factor is highest within the pelagic and neritic chains, where the first stage comprises phytoplankton. The silicone compound behaves, at least for a while, as a persistent pollutant, but the transfer and accumulation phenomena are extremely reduced and consequently it does not seem likely that harmful effects will be passed on to the consumer at the end of the chain. FATE AND TOXICITY OF HIGH DENSITY MISSILE FUELS RJ-5 AND JP-9 IN AQUATIC TEST SYSTEMS,
Georgia State Univ., Atlanta. Dept. of Biology.
J. C. Spain, and C. C. Somerville.
Chemosphere, Vol. 14, No. 2, p 239-248, 1985. 5 Fig, 2 Tab, 7 Ref.

Descriptors: *Fate of pollutants, *Fuels, *Water pollution effects, Biodegradation, Path of pollutants, Microorganisms, Shrimp, Sorption, Volatilization, Toxicity, Sediments.

The fate of the fuel components in lab test systems containing water and sediment collected from natural aquatic habitats was measured. Because the high density components seemed to be persistent, the toxicity of the fuels to microorganisms and Mysidopsis bahia were also examined. The difference in density between RJ-5 and JP-9 seems to determine the differences in their fate in aquatic systems. Volatilization of the components from JP-9 is much faster than from RJ-5 because JP-9 floats on the surface of the water. The difference is particularly notable with endo-endo-dihydrodi(norbornadiene) which is present in both fuels; it volatilized from JP-9 mixtues within a few days yet remained for much longer periods in RJ-5. Sorption to the sediment greatly reduced the volatilization of both fuels. The norbornadiene dimers have a higher affinity for sediment than the cyclopentadiene dimers but both types of compounds resisted weathering in the presence of sediment. The structural features of the high density synthetic molecules make them very resistant to microbial attack. Biological transformations of the norbornadiene dimers by the insertion of an oxygen atom were not detected. The fuels were not toxic to microorganisms at low to moderate concentrations but RJ-5 was toxic to mysid shrimp. The recalcitrance of RJ-5 to microbial degradation, affinity for sediment, density, and toxicity to aquatic macrobiota, suggest that a large-scale spill of the fuel could present major environmental problems. JP-9 appears to be much less of a potential problem in the aquatic environment than RJ-5 because of its higher vapor pressure and lower density. (Baker-IVI)

PREDICTING THE EFFECT OF TOXIC SUBSTANCES ON PELAGIC ECOSYSTEMS,
Department of Fisheries and Oceans, Burlington (Ontario). Great Lakes Fisheries Research Branch.
U. Borgman.
Science of the Total Environment, Vol. 44, p 111-121, 1985. 4 Tab, 20 Ref.

Descriptors: *Ecosystems, *Toxicity, *Prediction, Biomass size spectrum, Lake Ontario, Zooplankton, Phytoplankton, Fish, Body size, Water pollution effects, Growth, Nutrient load.

Recent advances in the description of pelagic ecosystems using the biomass size spectrum can be adapted to predict the effect of toxic substances on whole ecosystems. The method is demonstrated using Lake Ontario as an example. First, the shape of the biomass size spectrum is predicted. Using a previously published estimate of particle-size conversion efficiency (-log(biomass conversion efficiency)/log(predator-prey size ratio)), and an estimated exponent of the allometric relationship between body size and turnover rate of 0.24, the biomass over logarithmically equal size classes in Lake Ontario is estimated to be proportional to body size raised to the exponent-0.02. The biomass within various size classes is then estimated from data on zooplankton and phytoplankton biomass. Total biomass, from algae to fish, is estimated to be 7-16 g/sq m dry weight. The change in biomass and production over various size classes after addition of a toxic substance can then be predicted if the total nutrient load remains relatively constant and if the effect of the substance on biomass conversion efficiency is known. A toxicity sufficient to decrease growth and conversion efficiency by 50% is predicted to reduce production of large fish by 91%, but phytoplankton production by only 12% in the lake. Fish biomass is predicted to drop substantially, phytoplankton biomass should rise,

and zooplankton biomass should remain relatively unaffected. (Author's abstract)

DETOXIFICATION OF COPPER IN THE CELLS OF THE DIGESTIVE GLAND OF MUSSEL: THE ROLE OF LYSOSOMES AND THIONEINS,
Genoa Univ. (Italy). Ist. di Fisiologia Generale.
A. Viarengo, M. N. Moore, M. Pertica, G. Mancinelli, and G. Zanicchi.
Science of the Total Environment, Vol. 44, p 135-145, 1985. 4 Fig, 1 Tab, 26 Ref.

Descriptors: *Mussels, *Copper, *Toxicity, Lysosomes, Thioneins, Digestive gland, Heavy metals, Detoxification, Water pollution effects.

The data reported shows that copper is naturally present in the lysosomes and residual bodies of mussel digestive gland, the concentration of the metal being greatly increased for mussels exposed to Cu(2+) (0.04 ppm) for 3 days and then detoxified for 6 days. A procedure has been devised to solubilize the copper that is present in an insoluble form in lysosomes and residual bodies. This procedure disrupts lysosomes with sonication and solubilizes Cu-protein complexes in a hypotonic solution containing 1% 2-mercapto-ethanol and a mixture of antiproteolytic agents. The solubilized copper, representing more than 80% of the total metal present in the organelles, has been found mainly bound to a protein showing characteristics similar to those of metallothioneins: it has a high metal content, a molecular weight of about 12000 as evaluated by gel filtration, a relatively low UV absorbance at 280 nm and a high -SH content, as evaluated by the Shikata orcein cytochemical technique. The lysosomal extracts from the digestive gland of controls contain low basal levels of this copper-rich thionein-like protein which increases 5-6 times when the mussels are exposed to copper (0.04 ppm) for 3 days and then detoxified for 6 days. ACID DEPOSITION AND DRINKING WATER,
Wisconsin Univ.-Madison. Center for Limnology.
M. E. McDonald.
Environmental Science and Technology, Vol. 19, No. 9, p 772-776, 1985. 1 Fig, 1 Tab, 45 Ref.

Descriptors: *Acid rain, *Public health, *Drinking water, Aluminum, Copper, Cadmium, Corrosion, Asbestos, Lead, Groundwater, Surface water, Acid deposition, Water pollution effects.

Acid deposition could affect human health indirectly through two principal routes: bioaccumulation of chemicals in human food and contamination of drinking water. Acid deposition has been shown detrimental to aquatic ecosystems because of increased mobilization of trace metals. Acid deposition may enhance the scavenging of atmospheric contaminants, mobilize natural or synthetic contaminants in catchment areas, and promote corrosion of drinking water distribution systems. Numerous problems are associated with assessing human health risks from drinking contaminated water, such as subchronic effects, latency, antagonism, synergism, and general etiology. One of the most basic deals with the amount of water a person consumes daily. Contaminants of particular concern to human health include mercury, aluminum, copper, cadmium, lead, and asbestos. The source of drinking water is an important factor in determining its potential for being detrimentally affected by acid deposition. The major sources are groundwater and surface water. Other sources include cisterns and water suppliers. Research is needed to provide better estimates of affected populations and of the existing levels of the various contaminants in drinking water to which the affected populations are exposed. BIOCONCENTRATION FACTORS OF SOME HALOGENATED ORGANICS FOR RAINBOW TROUT: LIMITATIONS IN THEIR USE FOR PREDICTION OF ENVIRONMENTAL RESIDUES,
National Water Research Inst., Burlington (Ontario). Environmental Contaminants Div.
B. G. Oliver, and A. J. Niimi.
Environmental Science and Technology, Vol. 19, No. 9, p 842-849, 1985. 1 Fig, 7 Tab, 49 Ref.

Descriptors: *Biological magnification, *Trout, *Chlorinated hydrocarbons, *Brominated hydrocarbons, *Fish, Water pollution effects, Partition coefficients, Bioaccumulation, Lake Ontario, Animal tissues.

The bioconcentration factors, BCF's, for 34 chlorinated and brominated chemicals in rainbow trout have been determined by the steady-state approach by using chemical water concentrations in the nanogram per liter range. In addition, for 13 chemicals with a known half-life in trout, BCF's were also estimated by using the kinetic approach. The two methods gave comparable results for compounds with short half-lives in the fish but significantly different results for longer half-life chemicals. The BCF's have been shown to correlate well with octanol/water partition coefficients, Kow, for many of the study compounds. But the BCF's of high molecular weight compounds and compounds metabolized by the fish did not correlate with Kow. The laboratory-derived BCF's were compared to field-derived BCF's for Lake Ontario rainbow trout. This comparison showed that predictions based on laboratory BCF's were useful for chemicals with short half-lives in fish but were much too low for long half-life chemicals, where contaminated food is the major chemical source. GROWTH RESPONSE OF YELLOW-POPLAR (LIRIODENDRON TULIPIFERA L.) SEEDLINGS TO OZONE, SULFUR DIOXIDE, AND SIMULATED ACIDIC PRECIPITATION, ALONE AND IN COMBINATION,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Plant Pathology and Physiology.
A. H. Chappelka, B. I. Chevone, and T. E. Burk.
Environmental and Experimental Botany, Vol. 25, No. 3, p 233-244, 1985. 2 Fig, 4 Tab, 39 Ref.

Descriptors: *Poplar trees, *Acid rain, *Water pollution effects, *Ozone, *Sulfur dioxide, Plant growth, Air pollution, Trees.

Nine-week-old, half-sib, yellow-poplar were exposed to O3 and/or SO2 (controls, 0.10 ppm O3, 0.08 ppm SO2 or 0.10 ppm O3 + 0.08 ppm SO2, 4 hr/d/wk) in combination with simulated rain (pH 3.0, 4.3 or 5.6 1 hr/d, 2d/wk at 0.75 cm/hr) for 6 wk, with rain applied either just before or after fumigation. Across all rain treatments, O3 + SO2 resulted in a significant decrease in height growth and dry matter production and an increase in leaf area ratio (LAR) compared with controls. The combined effect of O3 and SO2 was additive in nature, except for root dry weight and leaf weight ratio (LWR) in which a greater than additive response was observed. The alteration in LAR was due to dry matter remaining in the leaves as indicated by an increase in LWR. Rain treatments altered leaf dry weight which appeared as a quadratic function across all pollutant treatments. A significant gaseous pollutant x rain pH interaction occurred for root dry weight, leaf area increase, mean relative growth rate (RGR), mean uni
rate (ULR) and chlorophyll content. Ozone
sure resulted in a linear decrease in roo
weight, leaf area increase, RGR and ULR,
acidity of rain increased (decreased pH), wh
fumigation with SO2 resulted in an increa
these growth variables as rain pH decreased.
rophyll content increased in both O3 and
treatments as the acidity of rain increased. Fu
tion of wet leaves caused a significant reducti
dry matter production, shoot elongation, leaf
RGR and ULR as compared with dry
across all treatments. The results of this
demonstrate that the effects of multiple poll
stresses are more deleterius than any single p
ant exposure for these half-sib seedling trees.
findings are discussed relative to possible im
tions on the effects of gaseous pollutants in c
nation with acidic precipitation on yellow-p
growth and productivity. (Author's abstract)

Residues of organochlorine pesticides, polyc
nated biphenyls (PCBs), polybrominated biph
(PBBs), polychlorinated styrenes (PCSs), and
cury were measured in the eggs of 10 speci
colonial waterbirds nesting in areas around
Bay or Lake Michigan from 1975 to 1980. Res
also were measured in the carcasses and brai
black-crowned night-herons (Nycticorax
corax). The highest residues were of PCBs,
mercury, and dieldrin; for some species, lev
these chemicals possibly were high enough to
caused reproductive effects. Other organochl
pesticides were found at low levels. Only
amounts of PCBs and PBBs were found. Eg
herring gulls (Larus argentatus) collected in
from an island in Lake Michigan containe
average of 100 ppm PCBs and 33 ppm DDE
was the most-contaminated species. Cattle e
(Bubulcus ibis), the only bird that is not a
eater, contained only small quantities of DDE
mercury. (Author's abstract)

ON OF GROWTH OF FRESHWATER GAE BY LONG-CHAINED ALI- MINES EMPLOYED IN SOLVENT ON PROCESSES,
Univ. (Sweden). Dept. of Botany.

f Environmental Contamination and Vol. 14, No. 5, p 609-620, September, 7 Tab, 48 Ref.

*Aliphatic amines, *Algal growth, ity, *Solvent extraction, Bioassay, Dia- ophyta, Chlorophyta, Amines, Water ects, Industrial wastewater.

ce on algal growth by six longchained ines, used in industrial solvent extrac- es, was investigated by a conventional nd, in addition, a simple assay where grown in liquid medium in 250 micro-l microtitration plates. Loss of solvent rom processes to ambient water repre- ntial environment problem. The pri- dary, tertiary and quaternary amines xception) had EC50-values based on (ECr) or algal biomass (ECb) at 0.01- 0-800 nM). This makes long-chained ines about a thousand times more toxic than short-chained amines on a molar basis. The difference in toxicity was interpreted as being due to different modes of action between the two groups of amines. The diatom Asterionella formosa and the blue-green algae Anabaena flos-aquae were more sensitive to the amines than the green-algae Selenastrum capricornutum, Monoraphidium pusillum or Chlorella emersonii. The maximum ECma/ ECmin ratio recorded was 19.5, for the primary amine. Anabaena flos-aquae was more sensitive by a factor 2-4 when grown under nitrogen fixation conditions than when supplied with combined nitrogen. Compared to other aquatic organisms, the algae show a particular sensitivity to amines. The microtitration test system was less sensitive than the flask test system. The low sensitivity of the microtitration test system is not an inherent property, but due to the use of an insensitive technique (visual inspection) for detection of algal biomass. The ECr50 and ECb50-values in the flask test system were both heavily time-dependent. (Author's abstract)

LYSOSOMAL ENZYME RELEASE IN THE BLUEGILL SUNFISH (LEPOMIS MACROCHIRUS RAFINESQUE) EXPOSED TO CADMIUM,
Michigan State Univ., East Lansing. Pesticide Research Center.
D. J. Versteeg, and J. P. Giesy.
Archives of Environmental Contamination and Toxicology, Vol. 14, No. 5, p 631-640, September, 1985. 9 Tab, 50 Ref.

Descriptors: *Sunfish, *Cadmium, *Enzymes, Toxicity, Water pollution effects, Stress, Starvation, Biological magnification, Bioaccumulation.

Lysosomal membrane lability and enzyme activities were measured in gill and liver tissues of the bluegill sunfish (Lepomis macrochirus). Exposure to sublethal cadmium concentrations for 10 or 21 days resulted in significant increases in the lability of liver lysosomal membranes, as measured by release of N-acetyl-Beta-D-glucosaminidase (NAG) and acid phosphatase (ACP). Acid phosphatase and NAG activites in liver were decreased by 10 day exposure to cadmium. However, after 21 days of exposure, liver NAG activity was elevated. Cadmium exposure did not affect the lysosomal lability index or the total enzyme activity of lysosomes isolated from gill tissue. In vitro exposure of isolated liver lysosomes to cadmium demonstrated that the increase in membrane lability was not a direct effect of cadmium on the lysosome. Stress induced by crowding the fish had no effect on liver lysosomal membrane lability. Starved bluegill sunfish had significantly destabilized lysosomes, as measured by both NAG and ACP. However, starvation did not affect the total activity of either enzyme. Neither size nor sex had any affect on lysosomal membrane lability, which indicates that field experiments will not be confounded by these factors. The problem of metal bioconcentration in fish has created the need for diagnostic tests which can be utilized to understand the biological effects of these contaminants on fish. The lysosomal membrane lability assay currently holds promise for use as a health monitoring tool. (Author's abstract)

ACTIVATION OF POLYCYCLIC AROMATIC HYDROCARBONS BY HEPATIC S-9 FROM A MARINE FISH,
North Carolina Univ. at Chapel Hill. Inst. of Marine Sciences.
D. M. Milling, and M. B. Maddock.
Bulletin of Environmental Contamination and Toxicology, Vol. 35, No. 3, p 301-307, September, 1985. 2 Fig, 13 Ref. EPA Grant R811134.

Descriptors: *Polycyclic aromatic hydrocarbons, *Activation, *Fish, Hydrocarbons, Aromatic compounds, Aquatic life, Genotoxicity, Water pollution effects, Organic compounds.

The possibilities for monitoring aquatic systems for genotoxic hazards, including polycyclic aromatic hydrocarbons (PAH's) with cytogenetic assays of feral fish are being examined. Possible differences in metabolism by fish and mammalian systems or by different fish systems can influence the genetic effects of metabolism dependent genotoxic chemicals, such as the PAH's. A preliminary indication of the ability of toadfish S-9 to activate a series of weakly carcinogenic and mutagenic PAH's in the Salmonella assay was undertaken. The first experiment was designed to provide information on the mutagenicities in plate assays of single concentrations of four PHA's to Salmonella strains TA1527, TA1538, TA98,and TA100 with increasing concentrations of S-9 from untreated and 3-methylchlanthrene-pretreated toadfish. Comparison of the results of this study with toadfish S-9 and available data for mammalia S-9 does not suggest substantial differences in the ability to activate the PAH's tested. (Baker-IVI)

ACUTE TOXICITY OF FOUR PHENOXY HERBICIDES TO AQUATIC ORGANISMS,
Dow Chemical U.S.A., Midland, MI. Mammalian and Environmental Toxicology.
H. C. Alexander, F. M. Gersich, and M. A. Mayes.
Bulletin of Environmental Contamination and Toxicology, Vol. 35, No. 3, p 314-321, September, 1985. 4 Tab, 12 Ref.

Descriptors: *Herbicides, *Toxicity, *Phenoxy compounds, *Water pollution effects, Organic compounds, Aquatic life, Daphnia, Fish, Mortality.

The herbicides tested include 2,4-D, 2,4-D dimethylamine salt, 2,4-D isooctyl ester, and MXPA isooctyl ester. The 2,4-D isooctyl ester and MCPA isooctyl ester were not toxic to aquatic organisms (daphnia and fish) at their water solubility levels, 0.006 mg/l and 0.003 mg/l, respectively. Fish mortality observed in this study were attributed to low pH values, well within the range reported as being lethal to fish. Differences in acute toxicity values reported for 2,4-D on both invertebrates and fishes could be due to water quality. The daphnid acute toxicity value from this study for 2,4-D dimethylamine salt is significantly higher than earlier studies. Conversely, the acute fish toxicity of 2,4-D dimethylamine salt reported in this study and others was similar. The 2,4-D isooctyl ester has a low water solubility and exhibited no acute toxicity to aquatic organisms at nominal concentrations up to 1,000 times its water solubility. The acute toxicity data from these studies may be used to predict toxicity to aquatic life as a result of an accidental spill to the environment. (Baker-IVI)
W86-01898

METALS AND PCB CONCENTRATIONS IN MUSSELS FROM LONG ISLAND SOUND,
National Marine Fisheries Service, Milford, CT. Milford Lab.
R. A. Greig, and G. Sennefelder.
Bulletin of Environmental Contamination and Toxicology, Vol. 35, No. 3, p 331-334, September, 1985. 2 Tab.

Descriptors: *Polychlorinated biphenyls, *Metals, *Mussels, *Long Island Sound, Cadmium, Copper, Heavy metals, Water pollution.

Mussels were collected from the mouths of various rivers and inshore areas along the Connecticut shoreline and analyzed for cadmium, copper, and polychlorinated biphenyls (PCBs). Levels of PCBs in mussels from all ten stations sampled were low, ranging from a mean of 0.049 to 0.115 ppm wet weight. Mussel samples from six stations ranged in PCB levels from 0.049 to 0 068 ppm, whereas mussels from the remaining four stations ranged from 0.084 to 0.115 ppm. From a public health standpoint, both concentrations are quite low compared to the 5 ppm limit set by the FDA for PCBs in fish and shellfish. Copper levels were also low in all mussel samples, with means ranging from 1.0 to 2.3 ppm. Mussels from only two stations had the lower levels of 1.0 and 1.1 Cu, whereas mussels from the other stations had levels in the range of 1.7 to 2.3 ppm. The levels of cadmium in mussels were low, with the exception of those taken from Bridgeport where the mussels had a mean level of 5.1 ppm. Mussels from the other stations had mean

levels of cadmium ranging from 0.41 to 1.3 ppm. (Baker-IVI)

EFFECT OF SELENITE ON THE UPTAKE OF METHYLMERCURY IN COD (GADUS MORHUA),
Fiskeridirektoratet, Bergen (Norway). Inst. of Nutrition.
O. Ringdal, and K. Julshamn.
Bulletin of Environmental Contamination and Toxicology, Vol. 35, No. 3, p 335-344, September, 1985. 4 Tab, 18 Ref.

Descriptors: *Selenium, *Methylmercury, *Cod, *Fish, *Metals, *Mercury compounds, Toxicity, Water pollution effects, Heavy metals.

The possible interaction of methylmercury and selenium in different tissues of cod and in feeding diets supplemented with nontoxic levels of the elements was examined. There were no significant differences in the mercury uptake in the muscle between the groups with methylmercury exposure. The mercury concentration in muscle increased steadily in all three groups during the whole experimental period. The selenium supplement did not seem to influence the mercury uptake, quantitatively or with regard to the uptake rate in the muscle. Among the three tissues analyzed, the muscle accumulated the highest concentrations of mercury during the 32 days of exposure without selenium supplementation. The mercury concentration in the liver in one group increased to approximately 0.62 mg/kg after 8 days, and this level was constant through the rest of the experimental period. The total uptake of mercury in the brain increased with the selenium supplementation. While these experiments can offer no information on the mechanism of a methylmercury-selenium interaction in cod, the results indicate such an effect through the altered uptake of these elements in the liver and the brain. ABSORPTION OF CU++ BY LONG-TERM CULTURES OF DUNALIELLA SALINA, D. TERTIOLECTA, AND D. VIRIDIS,
Montclair State Coll., Upper Montclair, NJ. Dept. of Biology.
B. Lustigman, J. Korky, A. Zabady, and J. M. McCormick.
Bulletin of Environmental Contamination and Toxicology, Vol. 35, No. 3, p 362-367, September, 1985. 1 Fig, 2 Tab, 14 Ref.

Descriptors: *Copper, *Absorption, *Salinity, *Algae, *Metals, Aquatic plants, Fate of pollutants, Path of pollutants, Plasmalemma permeability.

The effect of salinity on the absorption of copper by algae was studied by means of atomic absorption analysis. Long term cultures of Dunaliella were used to determine if alterations in plasmalemma permeability occur as a result of adaptation to different osmotic conditions. Since copper appears to affect the mechanisms involved in osmotic resistance, Dunaliella does not exclude copper from the cell. As the extracellular concentration of Cu(++) increases, the intracellular accumulation rises proportionately, so that the intracellular Cu(++) is greater at 50 ppm than in the controls. The resistance of Dunaliella to heavy metals does not appear to be due to exclusion from the cells. Salinity has a significant effect on the amount of copper accumulated by the algal cells. The presence of TRIS in the medium acts to chelate Cu(++) and maintain its concentration to a steady level throughout the experiment. Copper binds to the cell surface and therefore causes alteration of the transport systems. In hypotonic medium the cells remained swollen, while in hypertonic they failed to shrink. Greater permeability in hyposaline medium than in hypersaline, is indicated by the increased absorption of copper into the 2%S cultures than the 6%S. The increased lethality in hypotonic medium may be due to increased water in flux or to greater permeability of copper into the critical regions of the cell. The inverse relationship of salinity and copper permeability may apply to other heavy metal ions as well, which may help to explain the resistance of Dunaliella to heavy metal toxicity. (Baker-IVI)

5D. Waste Treatment Processes

COLOR REMOVAL PROCESS FOR KRAFT PULP AND PAPER MILL EFFLUENTS,
Lakehead Univ., Thunder Bay (Ontario). School of Engineering.
R. G. Rosehart.
Water, Air, and Soil Pollution, Vol. 25, No. 3, p 275-284, July, 1985. 5 Fig, 5 Tab, 8 Ref.

Descriptors: *Kraft mills, *Pulp Wastes, *Wastewater treatment, *Color removal, Sulfates, Chemical oxygen demand, Co-precipitation, Aluminum, Calcium, Chemical treatment.

An optimized co-precipitation process for color removal from Kraft pulp and paper mill effluents is described. A split addition process with 115 mg/L Al(+3) and 500 mg/L Ca(+2) appeared to be optimal with a removal percentage of 90.2. The addition of small amounts of a polyelectrolyte A did result in some nominal improvement over the standard process. An Al(+3)/Ca(+2) ratio of 0.23 appeared to give optimal results with the final pH in the 4 to 5 range. Dried sludge produced from the process had a reasonable energy value when combusted in a bomb calorimeter. The chemicals used in the suggested process are commonly available in most kraft mills. For pH control use is made of the acid effluent streams within the mill. Significant COD and hence BOD5 reductions take place during the process which may result in some operational savings during biological secondary treatment. Further development work is needed on a pilot plant scale to further optimize chemical addition rates and conditions and to optimize the mixing and temperature conditions of operation. (Baker-IVI)

NUMERICAL SIMULATION OF RECTANGULAR SETTLING TANKS,
Windsor Univ. (Ontario). Dept. of Civil Engineering.
S. M. Abdel-Gawad, and J. A. McCorquodale.
Journal of Hydraulic Research, Vol. 23, No. 2, p 85-100, 1985. 7 Fig, 1 Tab, 24 Ref, 1 Append.

Descriptors: *Settling tanks, *Wastewater treatment, Sedimentation, Model studies, Simulation, Hydrodynamics, Strip integral method, Sediment transport.

The strip integral method (SIM) is proposed as a simple, and computationally efficient approach to simulate the steady hydrodyamics and sediment transport in settling tanks operating in a neutral density environment. The method assumes a dominant flow direction; the partial differential equations are first reduced by partial integration to a system of ordinary differential equations in terms of a few preselected parameters which are functions of the independent variable, x. These equations are then integrated by methods like Runge-Kutta to give the velocity, the concentration profiles along the tank length and consequently the tank removal efficiency. The method requires the modeller to choose suitable shape functions and to perform the partial integrations. The shape functions given are valid only for tanks that have geometries similar to that demonstrated. Other tank geometries require different shape functions. Work is now in progress to provide more shape functions for different inlet conditions. The method can adequately simulate the major flow features in the tank, the mixing characteristics, the concentration distribution and the removal efficiency. The stability and convergence of the SIM is determined by the number and form of the shape functions; the Runge-Kutta solution is affected by changing the integration step and the order of the truncation error. Descriptors: *Nutrients, *Marshes, *Biomass composition, *Wastewater disposal, Peat, lands, Phosphorus, Environmental effects, level.

Experimental freshwater marsh plots (2,000 received 9.6, 3.7, and 1.5 cm/wk of treated effluent and the control plot received 4.4 c potable water during a 2-year study. Surface elevation above the peat substrate averaged in the second year. During the first year the surface remained dry. Application of treated ent increased net primary production only the dry year. During the wet year there significant difference between the highest plot and the control plot in aboveground bi or in phosphorus content in the abovegroun or dead vegetation and in the belowground tion. Based on the 2 years of the study, a increase in water level above the marsh had the same effect on the marsh productio nutrient accumulation as did application of 4 sq m/yr in treated effluent. This was presu due to the release of P from the peat sub under flooded conditions. (Author's abstract)

al Engineering, Vol. 92, No. 1, p 56-62, 1985. 87 Fig, 3 Ref.

tors: *Reverse osmosis, *Ultrafiltration, treatment, Wastewater treatment, Water Membrane processes, Membranes, Filtra-aporation.

ic principles of membrane separation are d and approaches are suggested to design ations and selection of membranes and nt for specific jobs. A separation process is selected on the basis of experience and an e evaluation of the alternatives. Analysis nosis and reverse osmosis assumes that the ie is impermeable to the solute, at least in on to the rate of solvent permeation. Ul-on obeys the same basic principle, and mplies the separation of macromolecules atively low molecular weight solvents. ortant factor to consider is the sensitivity rane permeability to factors other than ure. Aside from concentration polariza-ch represents a reduction in driving force, e permeability is subject to decline due to ion of supersaturated solute and to depo-gels and fine particulate debris that may dvertently with the feed. There are sever-criteria to be kept in mind in selecting ipment. A high membrane-surface-to-atio is good to minimize space require-d capital cost. Adequate structural sup-eeded to allow the thin membrane to the required pressure drop. Low pres-on the concentrate side of the membrane the driving force for permeation. Turbu-on the concentrate side or some alterna-as is needed to dissipate concentration on and minimize fouling. Ease of back-nd/or ease of membrane replacement is the event that fouling becomes a prob-g membrane life and low replacement d also be considered. (Baker-IVI)

NT OF WASTEWATER BY APPLI-O FOREST LAND,
niv., Brunswick. Marine Extension
W. L. Nutter, and J. L. Red.
Tappi Journal, Vol. 68, No. 6, p 114-117, June, 1985. 3 Tab, 11 Ref.

Descriptors: *Land disposal, *Wastewater disposal, *Forest watersheds, Industrial wastes, Municipal wastewater, Leaching, Wastewater renovation.

Forest land across the United States is receiving a variety of industrial and municipal wastewaters. This is particularly true in the Southeast where the availability of forest land makes this method of wastewater disposal particularly attractive. With proper design and operation procedures, drinking water standards for groundwater can be met, tree growth improved, and soil properties also improved. Three general pathways for water assimilation by land treatment are identified as biological degradation and/or plant uptake, accumulation in the soil, and leaching of mobile and nondegradable compounds to subsurface waters. The Unicoi forest is described as an example of a system that maintains excellent surface soil hydraulic properties, permitting all wastewater to infiltrate. If the soil is not disturbed during harvesting, the permeability will not be affected and wastewater loading can be maintained. The nutrient status of the soil has improved with wastewater application. The increased nutrient availability also resulted in significant increases in vegetation growth. Renovation of wastewater constituents meets applicable standards for each of the three categories of assimilation pathways: biological degradation and/or plant uptake, accumulation in the soil, and leaching of mobile and nondegradable compounds. EFFECT OF REACTOR TURBULENCE ON THE BINDING-PROTEIN-MEDIATED ASPARTATE TRANSPORT SYSTEM IN THIN WASTEWATER BIOFILMS,
New Hampshire Univ., Durham. Dept. of Civil Engineering.
T. T. Eighmy, and P. L. Bishop.
Applied and Environmental Microbiology, Vol. 50, No. 1, p 120-124, July, 1985. 3 Fig, 1 Tab, 38 Ref.

Descriptors: *Biological wastewater treatment, *Reactor turbulence, *Biofilms, *Aspartate, Shear stress, Bacteria, Turbulence, Transport systems.

This research documents an effect of reactor turbulence on the ability of gram-negative wastewater biofilm bacteria to actively transport L-aspartate via a binding-protein-mediated transport system. Biofilms which were not preadapted to turbulence and which possessed two separate and distinct aspartate transport systems (systems 1 and 2) were subjected to a turbulent flow condition in a hydrodynamically defined closed-loop reactor system. A shear stress treatment of 3.1 N /sq m for 10 min at a turbulent Reynolds number (Re = 11,297) inactivated the low-affinity, high-capacity binding-protein-mediated transport system (system 2) and resolved the high-affinity, low-capacity membrane-bound proton symport system (system 1). The Kt and Vmax values for the resolved system were statistically similar to Kt and Vmax values for system 1 when system 2 was inactivated either by osmotic shock or arsenate, two treatments which are known to inactivate binding-protein-mediated transport systems. It is hypothesized that shear stress disrupts system 2 by deforming the outer membranes of the firmly adhered gram-negative bacteria. (Author's abstract)

MATHEMATICAL SIMULATION OF A BIOFILM PROCESS,
Auburn Univ., AL. Dept. of Civil Engineering.
L. Benefield, and F. Molz.
Biotechnology and Bioengineering, Vol. 27, No. 7, p 921-931, July, 1985. 12 Fig, 1 Tab, 32 Ref.

Descriptors: *Biological wastewater treatment, *Biofilms, *Mathematical models, Simulation, Fixed-film process, Diffusion, Oxygen, Organic compounds, Differential equations.

A mathematical model has been developed for a fixed-film biological process (film flow over a flat plate) that describes bulk liquid transport, diffusional transport of oxygen and organics across a stagnant film, diffusional transport of oxygen and organics into the biofilm, biochemical reactions by the individual cells within the biofilm, biofilm growth, and cell density changes within the biofilm due to cellular decay. The model consists of two partial differential equations and three ordinary differential equations. It was assumed for model development that a lack of either organics or oxygen, or both simultaneously could limit the rate of the metabolic reactions. The two sets of differential equations are themselves coupled by a mass balance around the diffusion layer. The response of the model is illustrated through a numerical solution to the system of five differential equations using specified parameter values. The model illustrates how loading, contact time, biofilm thickness, diffusion layer thickness, and oxygen concentration interact to effect organics removal in a fixed film process. Although the model is developed specifically for film flow over a flat plate, the general system response (in a qualitative sense) due to changes in contact time and diffusion layer thickness will be similar for any film flow biofilm process. TRAINING: THE BRIDGE BETWEEN TREATMENT AND TECHNOLOGY,
B. Quinn.
American City and County, Vol. 100, No. 2, p 52-54, February, 1985. 2 Fig.

Descriptors: *Wastewater treatment, *Financial aspects, *Training, Education, Management, Operations, Public information.

Training is essential for wastewater treatment and disposal plant operators in light of more stringent regulations being placed on these facilities. It is critical for all operating personnel to understand what the system is as a whole and what it is designed to accomplish. Job-specific training is also needed in light of the introduction of various advanced technologies in wastewater treatment. Frequently those who find themselves in positions of managers, have risen through the ranks and have not had the advantages incurred through management training programs. This is another area of training which needs to be implemented in many water treatment facilities. With training being such an obvious need, the reason why it is so often lacking comes down to available money. Far too often the public feels its responsibility for funding ends once the construction of a wastewater treatment plant is complete. The public needs to be educated about the importance of protecting its investment. (Baker-IVI)

NEW IDEAS RESHAPING TREATMENT TECHNOLOGIES,
W. T. Lorenz.
American City and County, Vol. 100, No. 2, p 56-58, February, 1985. 1 Fig.

Descriptors: *Wastewater treatment, *Economic aspects, Membrane processes, Computers, Automation, Wastewater treatment facilities, Water reuse, Financing, Management.

Public officials are evaluating innovative and cost-effective technologies, as well as exploring alternative financing methods to meet the ever pressing demands for community wastewater treatment needs. Package wastewater treatment plants have been accepted for years as one solution to sewage treatment problems. Membrane technologies, as part of package treatment plants, are also in greater demand where higher quality effluent is desired, perhaps for recycling or reuse. There is a growing demand for instrumentation and sampling systems for monitoring the compositions and concentrations of substances found in influent resulting from industrial waste streams. Computer based services and software are fast becoming an important part of the water and wastewater treatment industry.

For small treatment plants, the tend is toward onsite microcomputer operations that can reduce staff requirements by as much as 75%. Significant progress in water recycling is now underway, due to improved economics, tighter water supplies and tradeoffs between treating water supplies and recycling. Two major obstacles to this thought are the high costs and the potential health hazards posed by reclaimed water. Many public officials are now realizing the need for a business approach to financing and managing municipal wastewater treatment systems. As that market grows, public officials will have to keep informed of the benefits and it falls of the changing technology in order to make the best decision for the advancement of wastewater treatment projects in their communities. SEEKING TREATMENT; SEWAGE SOLUTIONS IN SAN DIEGO,
W. P. Deddeh.
Oceans, Vol. 18, No. 4, p 63-64, July-August, 1985.

Descriptors: *Tijuana, *Mexico, *San Diego, *California, *Wastewater treatment, Municipal wastewater, Filtration, Public health, Water reuse, Wastewater renovation.

The problems of sewage spills and ocean disposal methods have caused grave concern among environmentalists, legislators, and government officials about the ecological balance of marine life. San Diego, California has a unique problem caused by the neighboring Mexican city of Tijuana. Lack of adequate sewage collection, treatment and disposal facilities in Tijuana have had a serious impact on Sán Diego's beaches and on the Tijuana River. It is unlikely that the sewage situation in Mexico will improve. Currently, under an agreement between the US and Mexico, San Diego treats 15 million gallons/day (MGD) of Tijuana's raw sewage at the Point Loma plant. The remainder, two MGD, is pumped to an ocean discharge point about three miles south of the border. The Tijuana sewage pipe breaks have forced beach quarantines for 307 days in 1981, 219 days in 1982, and 294 days in 1983. Holding ponds have been established which offer a temporary remedy to the situation. One alternative to the construction of a larger pipeline to the Point Loma plant which seems to have the backing of environmentalists and a number of engineers is one which uses a static screening process and plastic media, roughing filters, developed for industrial wastewater treatment. The screen and filter approach also does away with the need to build costly ocean outfalls for ocean discharge and allows the treated waste water to be used for reclamation projects in agriculture or industry. CASE STUDY ANALYSIS FOR SEASONAL NITRIFICATION: ECONOMIC EFFICIENCY AND WATER QUALITY PRESERVATION,
Lafayette Coll., Easton, PA. Dept. of Civil Engineering.
R. A. Ferrara, and M. A. Dimino.
Journal of the Water Pollution Control Federation, Vol. 57, No. 7, p 763-769, July, 1985. 5 Fig, 6 Tab, 6 Ref.

Descriptors: *Nitrification, *Economic aspects, *Wastewater treatment, *Water quality control, Seasonal variation, Water treatment facilities.

A case analysis demonstrated the elements of a cost effective wasteload allocation procedure for wastewater discharges. For many advanced wastewater treatment facilities, a single year-round effluent limitation is imposed. That limitation is normally based on maintenance of water quality standards during critical conditions of low waste assimilative capacity in the receiving water. Generally this critical condition occurs less than 1% of the time, and therefore these treatment facilities are required to be designed and operated to provide effluent quality far in excess of that necessary to preserve water quality most of the time. A practical approach for biological treatment systems is to assign seasonally varying effluent limitations. The approach is particularly appropriate for nitrification systems because of decreased rates of nitrification and lower ammonia toxicity in the receiving water during cooler times of the year. A statistically determined winter low flow criterion was proposed as the appropriate analog to the conventional 7 day 10 year low flow. In this case study, the annual operation and maintenance cost savings were substantial. It is recommended that regulatory agencies include these procedures routinely in specifying effluent limitations. Wastewater treatment facilities should be encouraged to reevaluate their methods of operation for innovative ways to minimize the costs of operation while still preserving stream water quality. Any reduction in other advanced treatment requirements that can be technically and economically justified while still preserving receiving water quality standards and uses should also be pursued. OPERATIONAL DYNAMICS AND CONTROL OF SECONDARY CLARIFIERS,
Clemson Univ., SC. Dept. of Environmental Systems Engineering.
T. M. Keinath.
Journal of the Water Pollution Control Federation, Vol. 57, No. 7, p 770-776, July, 1985. 13 Fig, 8 Ref.

Descriptors: *Secondary wastewater treatment, *Clarification, Wastewater treatment, Management, Maintenance, Operation.

Solids inventory control strategies have been described for several secondary clarifier overload situations including thickening overloads, and thickening and clarification overloads. A recycle rate control strategy was shown to be effective for thickening overloads and a certain class of thickening and clarification overloads. Effective solids inventory control for situations in which secondary clarifiers are grossly overloaded with respect to both thickening and clarification can be achieved only by applying a step-feed control strategy. Although the graphical approach was used in this research to illustrate various solids inventory control strategies proposed, many treatment plant operators may consider the approach too tedious. Consequently, the control algorithms described were incorporated in a software package designed to control the activated sludge system. This is available under a software package that also includes a data management and comprehensive total maintenance management program. When using the software, the operator inputs only the current influent and recycle flow rates and the MLSS value. The software analyzes the operational state of the system and specifies the type and extent of control action required, if any. This effectively relieves the tedium of the graphical procedure. are a key component of the liquid
istabilization (LSVS) process. Control
t did not contain worms failed in a
r period of time than did the reactors
with the worms. The LSVS reactors that were not overloaded functioned successfully for 140 to 198 days and were stopped only because the project ended. Oxidized nitrogen (nitrates) in the drainage from the LSVS reactors indicates that aerobic conditions were being maintained. Liquid primary sludge and liquid wastes activated sludge can be stabilized by the LSVS process. LSVS reactors were not adversely affected by short term, large variations in loading rates. Liquid primary sludge was stabilized to about the same degree as liquid aerobically digested sludge in the LSVS process. Moisture balances indicated an overall moisture loss of 4 to 20%. Loading rates of about 21000 g/sq m/week volatile solids or less resulted in satisfactory operation of LSVS reactors stabilizing liquid primary and liquid waste activated sludge. Loading rates greater than 1200 g/sq m/week volatile solids can be used for LSVS reactors stabilizing liquid aerobically digested sludge. With LSVS reactors, the disposal of residual stabilized solids occurs at long intervals. The total solids content of the stabilized residual solids in the LSVS reactors was from 14 to 24%, a considerable increase from the 0.6 to 1.3% that was added. LSVS is a successful process for both dewatering and stabilization. The stabilized residual solids had approximately the same characteristics regardless of the type of liquid sludge added to the reactors. Size and cost estimates indicate that LSVS may be an economically feasible sludge management process. (Baker-IVI)

INFLUENCE OF TRANSIENT PHENOMENA ON THE BIODEGRADATION OF NITRILOTRIACETIC ACID IN THE ACTIVATED SLUDGE PROCESS I: VARIATIONS IN HYDRAULIC LOADING AND SEWAGE STRENGTH,
Imperial Coll. of Science and Technology, London (England). Public Health Engineering Lab.
M. Hunter, T. Stephenson, J. N. Lester, and R. Perry.
Water, Air, and Soil Pollution, Vol. 25, No. 4, p 415-430, August, 1985. 6 Fig, 2 Tab, 56 Ref.

Descriptors: *Nitrilotriacetic acid, *Activated sludge process, *Biodegradation, Hydraulic load, Chemical oxygen demand, Temperature effects, Detergent builders.

The removal of nitrilotriacetic acid (NTA) following acclimatization in an activated sludge pilot plant has been studied during transient changes in operating conditions. These changes included increases in hydraulic loading and influent chemical oxygen demand (COD) and such phenomena in combination with transient temperature reductions. Short-term increases in hydraulic loading from 1 to 2 dry weather flow (dwf) had a very limited effect on NTA removal. Increasing the influent COD had a slight effect on NTA removal. Short term increases in hydraulic loading combined with transient reductions in temperature significantly reduced NTA removal. The effect of these combined changes on NTA removal was synergistic, rather than additive. Increases in influent COD combined with transient temperature reductions also caused a significant reduction of NTA removal. The effect of such combined changes on NTA removal was at most only additive. (Author's abstract)
W86-01609

INFLUENCE OF TRANSIENT PHENOMENA ON THE BIODEGRADATION OF NITRILOTRIACETIC ACID IN THE ACTIVATED SLUDGE PROCESS II. VARIATIONS IN INFLUENT METAL AND NTA CONCENTRATIONS,
Imperial Coll. of Science and Technology, London (England). Public Health Engineering Lab.
T. Stephenson, R. Perry, and J. N. Lester.
Water, Air, and Soil Pollution, Vol. 25, No. 4, p 431-450, August, 1985. 9 Fig, 5 Tab, 56 Ref.

Descriptors: *Nitrilotriacetic acid, *Activated sludge process, *Biodegradation, *Metals, Wastewater treatment, Cadmium, Chromium, Copper, Lead, Nickel, Zinc, Detergent builders, Temperature effects.

The removal of Cd, Cr, Cu, Pb, Ni, and Zn in an activated sludge pilot plant acclimatized to nitrilotriacetic acid (NTA) has been compared with an identically operated plant receiving no NTA. During steady-state operation the removal of Pb and Ni was reduced in the presence of NTA but there was no detectable difference in mixed liquor metal concentrations. Transient changes in the influent metal concentration of an order of magnitude had only a slight influence on NTA removal; Ni had the greatest effect, Cd and Cu some effect and Pb a negligible effect. Short term variations in influent NTA concentrations had no effect on NTA removal. A transient increase in influent NTA concentrations caused a slight decrease in NTA removal. Transient increases in influent Ni concentrations combined with reductions in temperature to 10 and 7.5 C had a slight adverse effect on NTA removal. This effect did not appear to be additive or synergistic. Combinations of transient increases in influent NTA concentration and reductions in temperature caused a significant decrease in NTA removal. The effect was synergistic rather than additive. (Author's abstract)

The Anamet Process is a anaerobic-aerobic process that was originally developed for the treatment of sugar production wastewater. The newest and most promising application of the Anamet Process concerns the cellulose and paper industry. In general, these wastewaters are more difficult to treat that the wastewaters from the food processing industry. Pilot plant studies were carried out to determine the treatability of cellulose and paper industry wastewaters using the Anamet Process. The first large scale application of the Anamet Process for the treatment of paper mill wastewaters indicates that these wastewaters are treatable using anaerobic methods. (Moore-IVI)

Water and Waste Treatment, Vol. 28, No. 6, p 50-52, June, 1985. 3 Fig.

Descriptors: *Wastewater treatment, *Industrial wastewater, Economic aspects, Food-processing industry, Pharmaceutical industry.

Industries where the need to handle liquid waste products is an important, but secondary unproductive and undesirable cost, are considered. These industries include food, pharmaceuticals and manufacturing plants where some chemical process is involved. The first requirement is for the manufacturer to identify and estimate the volume of the waste and the chemical and physical characteristics of its components. The most positive and productive step is to eliminate the creation of waste or pollution products. Consideration is given to the design of the effluent system, commissioning of the plant, and project management and coordination. (Baker-IVI)

Pilot scale trials were carried out at two papermills to assess various treatment systems for removal of BOD and effluents: biological filtration through plastic media, activated sludge, multi-media mechanical filtration and hydrogen peroxide addition. Despite some operating difficulties in both cases, activated sludge treatment and biological filtration are capable of substantial reductions in the concentrations of both BOD and sewage fungus nutrients. Mechanical filtration through graded media had no controlling effect on sewage fungus growth produced by clarified or activated sludge effluents; in the case of the primary clarified effluent, some increase in the concentration of glucose (a proven sewage fungus nutrient at this mill) was observed on filtration. On both a laboratory and pilot scale, treatment of clarified effluent with hydrogen peroxide plus ferrous sulfate reduced glucose levels substantially, but the effect on sewage fungus in experimental channels was less clear due to a low level of growth produced at this time by the control, untreated clarified effluent. CONTROL OF ACTIVATED SLUDGE FILAMENTOUS BULKING - VI; FORMULATION OF BASIC PRINCIPLES,
Vysoka Skola Chemicko-Technologicka, Prague (Czechoslovakia). Inst. of Water Technology and Environmental Protection.
J. Chudoba.
Water Research, Vol. 19, No. 8, p 1017-1022, 1985. 6 Fig, 1 Tab, 48 Ref.

Descriptors: *Bulking sludge, *Activated sludge process, Wastewater treatment, Microorganisms, Bacteria, Biological wastewater treatment, Dissolved oxygen.

Extensive research has been conducted concerning filamentous bulking during the past 20 years in numerous countries. A detailed analysis of these findings enables basic principles to be formulated for controlling filamentous bulking. Filamentous microorganisms are present in any activated sludge. Bulking problems appear when the filaments overgrow the floc-formers. Overgrowing of filamentous microorganisms in activated sludge is affected by composition of treated waste water, actual concentration of dissolved oxygen in an aeration tank, actual concentration of soluble substrate under which microorganisms grow, and technological parameters of the process. The microorganism which accumulates most of the amount of substrate in the selector or in an inlet part of the aeration system will be dominant in this system provided the regeneration period for exhaustion of all the accumulated substrate is sufficient. In the aeration system without separate sludge regeneration, all microorganisms have their accumulation capacities fully restored only at low sludge loadings. Filamentous microorganisms in activated sludge are slow-growers. Floc-forming microorganisms in activated sludge are fast-growers. (Baker-IVI)

USING THE SEWERAGE SYSTEM MAIN CONDUITS FOR BIOLOGICAL TREATMENT; GREATER TEL-AVIV AS A CONCEPTUAL MODEL,
Technion - Israel Inst. of Tech., Haifa. Dept. of Environmental and Water Resources Engineering.
M. Green, G. Shelef, and A. Messing.
Water Research, Vol. 19, No. 8, p 1023-1028, 1985. 1 Fig, 4 Tab, 8 Ref.

Descriptors: *Biological wastewater treatment, *Sewer systems, Tel Aviv, Israel, Model studies, Plug-flow reactors, Aeration, Construction costs, Corrosion control, Loop system.

The long-sought idea of using main sewerage conduits as a step-fed plug-flow reactor, where biological sludge is introduced at the head of the main pipelines (hence loop system) and where aeration is provided at various points along the loop, was investigated in this paper in a bench-scale physical model using the Greater Tel-Aviv (Dan Region, Israel) sewerage with design population of 1.3 million and flow of 300,000 cu m/day, as a conceptual model. Due to the inherent advantages of a step-fed plug-flow reactor where high substrate concentrations are maintained along most of the length of the reactor, (except for the final section which provides effluent polishing), the viability of the biomass is 3-5.2-fold higher than the one usually encountered in a conventional activated sludge plant, thus substantially increasing its rate and efficiency of organic substrate removal. It has been shown that in the case of Greater Tel-Aviv, replacing the activated sludge conventional treatment plant with the loop system (with only secondary clarifiers to provide the return biological sludge), or alternatively resorting to the loop system instead of doubling an existing overloaded treatment plant, will produce final effluents well below the requirements of 25 mg/l BOD5 and will provide savings of more than 50% in construction costs. An additional advantage of corrosion control along the main conduits thus increasing their longevity is also discussed. (Author's abstract)

MODELING AND EFFICIENCY OF ULTRAVIOLET DISINFECTION SYSTEMS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
R. G. Qualls, and J. D. Johnson.
Water Research, Vol. 19, No. 8, p 1039-1046, 1985. 6 Fig, 3 Tab, 24 Ref. EPA grant R80470010, NSF grant CEE82-05274.

Descriptors: *Model studies, *Ultraviolet radiation, *Disinfection, *Wastewater treatment, Bacteria, Dispersion, Efficiency, Ultraviolet disinfection.

Disinfection of wastewater effluents with ultraviolet (u.v.) light has recently become a rapidly growing alternative to chlorination, but there have been difficulties in measuring u.v. dose. A model is presented which predicts bacterial survival in flow-through systems. The calculation takes into account the complex intensity patterns, non-ideal flow patterns, and non-linear curves of log survival vs u.v. dose. Based on the organismal dose-response, the number of survivors in each fraction of the residence time distribution is calculated separately and summed to calculate the average survival. The model uses as input data the average u.v. intensity within the system, the residence time distribution, and an experimentally determined dose-survival curve in a simplified system where dose can be directly measured. The predictions of the model corresponded well with measured survival in a u.v. pilot plant study. The model was used to show the effects of flow dispersion on average survival by varying residence time distribution. Measures of capacity and efficiency of u.v. systems were derived and illustrated experimentally in simple cylindrical batch units and in two multiple lamp units. Model calculations can be a useful tool for research and development of reactor design. (Moore-IVI)

stewater treatment.

radation of seven chlorinated aromatic
ds in anaerobic sewage sludge from three
communities was examined. The com-
ested were 2,4-D (2,4-dichlorophenoxy
d), 2,4,5-T (2,4,5-trichlorophenoxy acetic
P (penta-chlorophenol), 2,4,6-trichloro-
nd 2-, 3-, and 4-chlorophenol. All of the
ds tested were degraded in one or more
dges during a 70-d incubation period.
-chlorophenol was the most persistent
l tested followed by 3-chlorophenol. The
l degradative reactions were cleavage of
linkage of the phenoxy acetic acid herbi-
D, and 2,4,5-T, and the removal of Cl
ho to the phenolic OH group of the
nols. The initial products of 2,4-D and
egradation were 4-chlorophenol and
lorophenol. Reductive dechlorination of
orophenol (produced from 2,4,5-T) gave
ophenol and 4-chlorophenol which
final products of 2,4,5-T degradation.
tion of PCP gave 3,4,5-trichlorophenol
al transformation product, and further
tion gave 3,5-dichlorophenol as final
PCP degradation. The Jackson sludge
reatest capacity to degrade the com-
ted. With the exception of 3- and 4-
ol, all other compounds tested were
degraded in 7 to 14 d in the Jackson
son and Adrian sludges were similar in
dative pathways overall, but significant-
ve than the Jackson sludge. (Author's

RUSSIAN USE OF FLOTATION FOR WASTEWATER TREATMENT,
Vsesoyuznyi Nauchno-Issledovatel'skii Inst. Vodosnabzheniya, Kanalizatsii, Gidrotekhnicheskikh Sooruzhenii i Inzhenernoi Gidrogeologii, Moscow (USSR).
N. Myasnikov, L. V. Gandurina, and L. N. Butseva.
Effluent and Water Treatment Journal, Vol. 25, No. 6, p 202-206, June, 1985. 4 Fig, 4 Ref.

Descriptors: *Wastewater treatment, *Flotation, Sediments, Petroleum products, Oil, Fats, Surfactants, Water treatment, Physical properties, Chemical properties, Activated sludge.

Schemes and techniques being used in Russia for oils, fats, petroleum products and surfactants removal from wastewaters by flotation are reviewed. The following kinds of flotation are being used at present for treatment of sediments and activated sludges: compression (pressure), impeller, vacuum, biological, chemical, electric and ionic flotation, froth separation. For the sake of further development of methods and structures of flotation plants for wastewater purification and sediment treatment, attention should be paid to the following aspects: increase in operating efficiency of devices for dissolving air and gas in liquid; providing optimum conditions of flotation separation of gas and liquid medium; studying hydrodynamic conditions of frother cells; studying physical and chemical properties of water air medium; creating reagents for floation treatment of wastewater and compaction of sediments and activated sludges; studying flotation process accompanied by sorption, adsorption, and oxidation; designing combined installations; studying the pecularities of flotation treatment of wastewater and final treatment of biologically purified water with activated sludge compaction; designing devices for froth removal, its processing and reclaiming of valuable components; designing automatized flotation plants; and generalizing the operational results of flotation plants and their technical and economic evaluation. RECLAIMING DESERT LANDS THROUGH WATER REUSE,
Goff Consulting and Engineering Corp., Chandler, AZ.
J. D. Goff, and P. L. Busch.
Journal of American Water Works Association, p. 84-87, July, 1985. 1 Fig, 4 Tab.

Descriptors: *Water reuse, *Land reclamation, Deserts, Urban areas, Municipal wastewater, Wastewater treatment facilities, Urban areas, Chandler, Arizona.

The city of Chandler, Arizona, has implemented a program for total reuse of its municipal wastewater effluent. The municipal water system is supplied from groundwater sources that are being pumped at a rate far in excess of the rate of recharge. To meet the total future water supply needs, reuse of municipal wastewater is essential. A new reclamation facility will serve as the cornerstone of the city's program, which has several unique aspects. The new wastewater treatment facility will be sited where there is no adjacent watercourse, thus necessitating complete reuse of its effluent. Financing, ownership, and operation of the facility are being done through privatization. The reuse system has been developed through a public-private partnership between the city and landowners whose property borders the facility. The facilities will include an effluent pipeline and an artificial lake system, to be surrounded by a golf course, greenbelt area, and areas designated for residential and commericial development. BACTERIAL ADHESION AND FOULING OF REVERSE OSMOSIS MEMBRANES,
Orange County Water District, Fountain Valley, CA. Water Factory 21.
H. F. Ridgway, M. G. Rigby, and D. G. Argo.
Journal of the American Water Works Association, p 97-106, July, 1985. 16 Fig, 36 Ref.

Descriptors: *Wastewater renovation, *Reverse osmosis, *Membrane processes, *Bacteria, Biofouling, Mycobacterium, Escherichia, Acinetobacter, Cellulose acetate, Hydrophobic interaction.

Adhesion of selected bacteria to cellulose actetate (CA) reverse osmosis (RO) membranes used in wastewater reclamation processes was investigated to determine its role in membrane fouling and reduces process efficiency. Adhesion of a Mycobacterium sp. previously isolated from an early stage of RO membrane biofouling was relatively unaffected by large variations in the ionic strength or pH of the buffer system. However, trace quantities of a polyoxyethylene ether nonionic detergent almost completely inhibited attachment. The mycobacteria were found to adhere to the CA membrane surface (or to a CA-affinity column) approximately 25-fold more effectively than a wild-type strain of Escherichia coli. The ability of Mycobacterium and E. coli to adhere to the membrane was correlated with their relative surface hydrophobicities as determined by their affinities for n-hexadecane. A similar correlation was established between a hydrophilic wild-type strain of Acinetobacter phosphadevorus containing a single 17.8 mega-Dalton plasmid (PYG1) and a more hydrophobic isogenic derivative strain (P7P-) lacking the PYG1 plasmid. Unlike the P7WT parent strain, the P7P- derivative produced more fimbrialike appendages, which may account for its enhanced hydrophobic and adhesive properties. The results suggest that hydrophobic interactions between bacterial cell surface components and the CA membrane surface play an important role in the initial stages of bacterial adhesion and RO membrane biofilm formation. EFFECTS OF SEWAGE EFFLUENT ON ENDOMYCORRHIZAL DEVELOPMENT IN ACER,
Michigan Univ., Ann Arbor. School of Natural Resources.
P. C. Otto, and J. R. Boyle.
Canadian Journal of Forest Research, Vol. 14, No. 2, p 246-249, April, 1984. 3 Fig, 5 Tab, 21 Ref.

Descriptors: *Wastewater irrigation, *Maple trees, *Endomycorrhizae, Phosphorus removal, Nitrogen removal, Wastewater renovation, Forests, Michigan.

Application of stabilized sewage effluent on forested sites has proved an effective means of removing phosphorus and nitrogen which could otherwise cause overabundant growth in lakes and streams. The effects of such applications on mycorrhizal association must be included in a complete evaluation of the effects of sewage effluent application to hardwood forest sites. Secondarily treated sewage effluent was sprayed into a 50-year-old beech-maple forest near Harbor Springs, Emmet County, Michigan. Effluent was applied at rates of 0, 3.8, and 7.6 cm per week onto thinned and unthinned plots during the growing seasons of 1978 and 1979. Each spray rate and density combination was replicated four times. Acer sp. roots were examined each growing season to evaluate development of endomycorrhizae. Numbers of mycorrhizae were significantly greater in the sprayed than in the unsprayed plots but did not vary significantly with month of thinning. Nutrient additions and increased water availability may have contributed to the mycorrhizal increases at this site. The endomycorrhizal increases observed on this study site further indicate the suitability of these hardwood sites for use in wastewater renovation. (Moore-IVI)

CALCULATION OF OXYGEN CONSUMPTION AND AMOUNT OF EXCESS ACTIVATED SLUDGE IN MULTISTAGE AERATION TANKS,
Kievskii Tekhnologicheskii Inst. Pischevoi Promyshlennosti (USSR).
S. P. Tsygankov.
Water Resources, Vol. 11, No. 4, p 386-390, July-August, 1984. 1 Fig, 1 Tab, 9 Ref. Translated from Vodnye Resursy, No. 4, p 139-143, July-August, 1984.

Descriptors: *Biological wastewater treatment, *Activated sludge process, *Oxygen consumption, *Aeration tanks, Sludge, Mathematical equations, Energy, Wastewater treatment.

Taking into account the energy consumption of the process of biological treatment, which increases with increasing pollution of wastewaters, it is quite important to select the most economical multistage systems. Economy is determined mainly by oxygen consumption and the amount of activated sludge formed, the utilization of which requires certain expenditures. Methods of calculation are developed which are suitable for optimization of sectional or multistage aeration tanks with respect to oxygen expenditures and formation of excess activated sludge. A schematic diagram is presented of the flows of the aeration tank-mixer and secondary sedimentation tank. The conventional assumptions are introduced that processes of an increase of biomass and utilization of the substrate do not occur in the sedimentation tank and there is no activated sludge biomass in the clarified liquid leaving the sedimentation tank. Despite the smaller consumption of the substrate in the second stage, the oxygen requirement is higher owing to oxidation of the incoming activated sludge biomass. The specific consumption of oxygen for treatment increases with decrease of the specific rate of increase of biomass. The latter depends on the flow rate of the biomass entering the aeration tank from the secondary sedimentation tank or from the preceding aeration tank. The specific oxygen consumption and productivity of the aeration tank with respect to biomass are inversely related. The equation obtained can be used for optimization calculations of the stoichiometry of single- and multistage aeration tanks. (Baker-IVI)

ROLE OF MACROPHYTES IN REMOVING ALIPHATIC AMINES FROM WATER,
Irkutskii Gosudarstvennyi Univ. (USSR). Biological and Geographical Research Inst.
S. S. Timofeeva, and O. A. Men'shikova.
Water Resources, Vol. 11, No. 3, p 240-244, May-June, 1984. 4 Fig, 10 Ref. Translated from Vodnye Resursy, No. 3, p 109-113, May-June, 1984.

Descriptors: *Water treatment, *Macrophytes, *Methylamine, Aliphatic hydrocarbons, Organic matter, Aquatic plants, Waterweed, Biological wastewater treatment.

The elimination of methylamine from water by a number of macrophytes and possible mechanisms of this process were investigated, and the possible use of macrophytes in wastewater treatment is discussed. Of the various macrophytes investigated, waterweed had the the maximum rate of elimination of methylamine. While it was not possible to make unequivocal conclusions about the mechanism of the elimination process, both the following components most likely made a substantial contribution to the methylamine elimination process: the diffusion entry and accumulation and enzymatic conversion with the participation both of oxidizing enzymes and other enzymes participating in nitrogen metabolism of plants. Waterweed effectively eliminated methylamine, and methylanime was not detected after 2 days following treatment. The successive introduction of methylamine once a week showed that a waterweed biofilter can actively purify water during the entire time of this study, up to 2 months. When the phytomass of waterweed increases, it is necessary to remove it and keep it within the optimal conditions of 5 g/liter. Waterweed can remove aliphatic amines not only of technogenic origin but also those which are formed upon decomposition of phytoplankton and naturally makes a substantial contribution to self-purificaton of water bodies and to water quality. USE OF MACROPHYTES FOR TREATING AGRICULTURAL RUNOFF,
N. V. Morozov.
Water Resources, Vol. 11, No. 3, p 259-268, May-June, 1984. 3 Fig, 6 Tab, 39 Ref. Translated from Vodnye Resursy, No. 3, p 131-141, May-June, 1984.

Descriptors: *Macrophytes, *Wastewater treatment, *Agricultural runoff, Biological wastewater treatment, Runoff, Agricultural chemicals, Fertilizers, Farming, Aquatic plants.

Measures aimed at protecting waters from surface runoff from cultivated land can be divided into three groups. The first calls for improvement of farming practices. The second includes measures to prevent the inflow of polluted surface and drainage runoff by diverting it into lagoons, stabilization and oxidation ponds, buffer reservoirs, or other holding areas. The third group is aimed at the accumulation and decontamination of the diffuse surface runoff. Biological ponds with their photosynthetic aeration by microalgae and higher aquatic plants have potential application for decontaminating surface waters. The considerable filtering, accumulating, absorbing, and mineralizing ability of macrophytes makes them a powerful factor for biological self-purification of fresh and brackish waters. Duckweed showed maximum activity in extracting nitrate and nitrite nitrogen from the water. The ability of macrophytes to remove fertilizers from water improves in June and July, which is related to the period of active physiological activity of the plants. In these months the content of nitrite nitrogen in experiments with bulrush and cattail decreased by more than tenfold as early as five days after fertilizer application. Experiments with bulrush, narrowleaf cattail, and waterweed showed that waterweed extracts nitrates more than nitrites from wastewaters. The use of higher aquatic plants for treating highly eutrophic waters can be accomplished by introducing them in the littoral zones and mouths of small rivers, in shallows of reservoirs, or in canals, buffer storages, biological ponds or lagoons, specially created for this purpose. Descriptors: *Wastewater treatment, *Activated sludge process, *Evaluation, *Stochastic process, Aerobic digestion, Mathematical equations, Carbon dioxide, Oxygen, Carbon.

The relationship between the technological parameters of a treatment process and material and energy balance in apparatus consisting of a biochemical reactor (mixer) and biomass sedimentation tank was investigated. The balance of elements was studied during continuous culturing of activated sludge microorganisms on wastewaters of a swine-raising complex in the ANKUM-2 apparatus at a temperature of 20 degrees C. The working volume of the fermenter was 1 and 2 liters, the rotational speed of the stirrer was 500/min with complete oxygen saturation of the fluid. Culturing was carried out at various dilution rates: 0.16, 0.04, and 0.02/hr. The fermenter was connected with the sedimentation tank by a 1 liter vessel, for withdrawing the excess and recirculating biomass for which a peristaltic pump was used. Equations are derived which can be used for evaluating aerobic wastewater treatment systems. (Baker-IVI)

for acid leaching is one of the major ncern in the landfilling of heavy metal possible to create barriers against migration around the toxic particles themselves, rather than around a landfill as a whole. The CHEMFIX process starts with a concentrated solution of sodium silicate, which is mixed with the waste. This is in turn mixed with cement. In the final mixture, the cement reacts with the evenly distributed silicate to give a gel around the waste particles that creates the desired barriers to migration. The artificial clay-like solid resulting from the stabilization of toxic waste using the CHEMFIX process has many advantages. The CHEMFIX waste-form, because of its low permeability, high buffer capacity against acid leaching and its clay-like structure and properties, can be used to stabilize heavy metal sludges for landfilling. A simple model is developed and used to investigate the values of the various parameters involved in the product design. The immobilization periods expected for a CHEMFIX wasteform monolith are in excess of current design values for screens and liners. (Moore-IVI)

EFFECT OF LEACHING ON THE INTEGRITY OF A NATURAL CLAY,
McGill Univ., Montreal (Quebec). Geotechnical Research Centre.
R. N. Yong, D. S. Elmonayeri, and T. S. Chong.
Engineering Geology, Vol. 21, No. 3/4, p 279-299, June, 1985. 22 Fig, 3 Tab, 17 Ref.

Descriptors: *Leaching, *Clay, *Strength, *Integrity, Liners, Waste ponds, Soil properties, Water pollution prevention, Chemical properties, Boundary conditions, Soil structure.

Clay minerals have long been used as ion-sieving filters, separators, or reinforcing elements to prevent contamination of the domestic groundwater from the transmission of polluted liquids through the bottom and side boundaries of waste holding ponds. Leaching effects on the strength of a natural clay substrate can lead to loss of integrity of pond containment situation, especially if the clay material constitutes the liner system for the containment pond. The integrity of the clay in the face of five different types of leachates is studied via the creep characteristics of the clay. The leachate types include sodium silicate, sodium chloride, sodium acetate, saturated calcium hydroxide solution plus 10 carbon dioxide air, distilled water and a reference natural untreated water sample. The resultant effects are evaluated in terms of soil fabric/structure reinforcement or degradation, and changes in the relationships established between soil particles and chemical pore fluid. The integrity of the clay is severely conditioned by factors producing the initial soil structural state, the chemistry of the leachate, local boundary conditions, and time. (Moore-IVI)

US SLUDGE MANAGEMENT GUIDELINES EXPLAINED,
E. D. Lomnitz.
Water and Water Treatment, Vol. 28, No. 4, p 37, 40, April, 1985.

Descriptors: *Sludge management, *Standards, Management, Planning, Sludge disposal, Wastewater management.

An EPA sludge task force was established in 1982 which was responsible for assessing the magnitude and management approaches to municipal sludge reuse and disposal nationwide, evaluating strengths and weaknesses of past regulatory activities, and identifying data and informational needs in order to direct EPA research in the field. In developing regulations for reuse/disposal options, several key areas need to be considered including the identification of potential pollutants, the magnitude of hazard or risk, levels at which these pollutants cause these risks, the existence of management practices which could reduce the risks, and the relevant risks between the various reuse/disposal options. With the completion of technical support documents, drafting of the proposed regulations can commence. The proposed regulations will clearly delineate the requirements in terms of management practices and numeric standards. The regulations will also contain compliance monitoring requirements. EFFECT OF SEWAGE SLUDGE ON MICROBIAL ACTIVITY IN AN OLD, ABANDONED MINESOIL,
Cornell Univ. Agricultural Experiment Station, Ithaca, NY. Dept. of Agronomy.
H. F. Stroo, and E. M. Jencks.
Journal of Environmental Quality, Vol. 14, No. 3, p 301-304, July-September, 1985. 3 Tab, 45 Ref. West Virginia University Mining and Mineral Res. Inst. project MI8050R.

Descriptors: *Sludge, *Water pollution effects, *Land reclamation, *Mining, *Minesoils, *Microbial activity, Enzymes, Amylase activity, Phosphatase activity, Respiration, Urease activity, Fescue, Waste disposal, Land treatment.

The effect of lime, fertilizer, and sewage sludge (50 and 100 kg/ha) upon microbial activity and growth of sparsely distributed tall fescue (Festuca arundinaceae Schreb.) on an old, acidic, infertile sandy loam (Typic Udispolents; loamy-skeletal, mixed, acid, mesic) minesoil was evaluated. Respiration rate and activities of amylase, urease, and phosphatase were used as indices of microbial activity. When compared with the control, lime significantly increased respiration rate, had no effect upon amylase and urease activities, and significantly reduced phosphatase activity. Fertilizer significantly increased respiration rate and amylase activity, but significantly decreased urease activity. Phosphatase activity was not affected by fertilizer applications. Lime plus fertilizer significantly increased respiration rate and amylase activity, had no affect upon phosphatase activity, while it drastically reduced urease activity. Sludge at both rates of application in conjuction with lime and fertilizer (S1LF, S2LF) are only compared with the lime-fertilizer treatment. Both S1LF and S2LF significantly increased respiration rate and urease activity; S2LF was significantly more effective more than S1LF. Amylase activity was significantly increased by both S1LF and S2LF, although there was no difference between the two treatments. The S1LF had no effect upon phosphatase activity, whereas activty, whereas S2LF caused a significant activity increase. All treatments produced significant increases in tall fescue yield. Fertilizer was significantly more effective than lime. The fertilizer and the lime-fertilizer treatments were about equally effective. Both S1LF and S2LF produced yields that were significantly greater than the lime-fertilizer treatment. The S2LF had a significantly greater effect upon yield than did S1LF. (Author's abstract)

CONDITIONING OF ANAEROBICALLY DIGESTED SLUDGE,
Camp, Dresser and McKee, Inc., Raleigh, NC.
A. I. Cole, and P. C. Singer.
Journal of Environmental Engineering, Vol. 111, No. 4, p 501-510, August, 1985. 10 Fig, 1 Tab, 6 Ref.

Descriptors: *Anaerobic digestion, *Sludge conditioning, *Polyelectrolytes, Electrolytes, Biological treatment, Digestion, Polymers, Wastewater treatment.

Synthetic organic polyelectrolytes can be used to condition sludges to enhance their dewaterability. When conditioning biological sludges, the charge on the polymer has a significant impact on the effectiveness of the polymer as a conditioner. The objectives of this investigation were to determine the most effective type of polymer product for conditioning anaerobically digested sludge prior to dewatering, and to investigate how the chemical characteristics of the polymer influence the way it interacts with the sludge particles. Capillary suction time and particle electrophoretic mobility measurements were employed to achieve this objective. The results indicate that cationic polymers with molecular weight in excess of 1,000,000 appear to be required for effective conditioning. However, effective sludge conditioning can be achieved with either high or low charge density cationic polymers and that dosing to achieve charge neutralization of the sludge particles is not a prerequisite for effective sludge conditioning. Descriptors: *Disinfection, *Chlorine, *Chlorine dioxide, *Trihalomethanes, *Chlorite, Water treatment, Drinking water, Chlorination, Oxidation, Lake Kinneret, Israel.

Chlorine dioxide is one of the most promising alternatives to chlorine for the disinfection of drinking water. One of the major advantages of chlorine dioxide over chlorine is that it does not produce trihalomethanes (THM); however, chlorine dioxide is reduced mainly to undesirable chlorite. Mixtures of ClO2 and Cl2 may successfully reduce the formation of both THM and chlorite in the absence of bromide. The ClO2 may compete with chlorine for the organic precursors, thus reducing the formation of chlorinated by-products, while the chlorine can, in turn, oxidize the chlorite, which is the main reduction product of chlorine dioxide. When Lake Kinneret water in Israel was studied, however, it was found that such mixtures caused only a minor reduction in the formation of THM compared with chlorine alone. This is probably due to the presence of 2 mg/l bromide in the water of Lake Kinneret. The formation of THM and chlorite may be satisfactorily reduced (by about 60% and 90%, respectively), if chloride dioxide is allowed to react in water with the THM precursors before chlorine is introduced. IMPROVEMENTS IN TREATMENT PERFORMANCE AT GRAFHAM WATER TREATMENT WORKS: ANGLIAN WATER,
C. Harward.
Journal of the Institution of Water Engineers and Scientists, Vol. 39, No. 3, p 225-230, June, 1985. 4 Fig, 2 Tab, 3 Ref.

Descriptors: *Water treatment facilities, *Grafham Water Treatment Works, *England, *Water treatment, Coagulation, Aeration, Soda ash, Filtration, Sludge.

The effect of modifying the coagulant aid dosing system and other operational changes which resulted in the achievement of the desired increased efficiency at the Grafham Water Treatment Works are reviewed. During the winter of 1983-84 a prolonged increase in demand for water at a time of low water temperatures (3-6 C) resulted in treatment difficulties when flows exceeded 182 Ml/d. Improved polymer dispersion and increased delay between coagulant and coagulant aid dosing resulted in marked improvement in floc blanket stability and settled water quality. This enabled substantial savings in treatment chemical costs to be made and increased the treatment capacity of the works during the period when water temperatures were low. Changes in filter washing practices combined with improved settled water quality reduced the number of daily filter washes, thereby further reducing costs. (Baker-IVI)

MODELING THE EFFECTS OF HYDROLYZED ALUMINUM AND SOLUTION CHEMISTRY ON FLOCCULATION KINETICS,
Syracuse Univ., NY. Dept. of Civil Engineering.
R. D. Letterman, and D. R. Iyer.
Environmental Science and Technology, Vol. 19, No. 8, p 673-681, August, 1985. 7 Fig, 4 Tab, 29 Ref, 1 Append.

Descriptors: *Flocculation, *Computer models, *Aluminum compounds, Model studies, Coagulation, Solution chemistry, Surface properties, Ionization, Complexation, Particulate matter.

Computer programs are available that allow self-consistent calculations to be made simultaneously for solution and surface chemical equilibria. One of these programs, an augmented version of MINEQL, employs the Gouy-Chapman-Stern-Grahame model of the electrical double layer to account for the distribution of charge and potential at the solid solution interface. In this study the modified program has been used to predict the effects of solution and suspension variables on flocculation efficiency when aluminum salt coagulants are used. Electrophoretic mobility measurements and constant pH titrations with the surface complexing sulfate ion have been used to determine intrinsic surface ionization and complexation constants for the aluminum sites. Expressions that relate the model-predicted electrical double-layer characteristics of the aluminum-treated particles and the amount of aluminum hydroxide coating on the particles to the efficiency of flocculation are also employed. For the simple system tested, model predictions of relative flocculation efficiency are in reasonable agreement with batch flocculation results. (Author's abstract)

The removal of natural humic and fulvi
stances found in water supplies, through the
activated carbon beds is under study. The ef
a main component of domestic detergents,
triphosphate (STP), on the adsorptive capac
powdered activated carbon (PAC) for co
cially supplied humic acids was determined
ferent pH values in distilled water. A first
equilibrium study showed an effective en
ment of adsorption capacity for humic aci
function of STP concentration in a non bu
media (pH of distilled water, close to 5.0).
absorption analysis of humic acids indica
increase of 93% (500 mg/l PAC) and 133%
mg/l PAC) in the carbon adsorption efficien
a STP concentration from 0.2 to 1.0 mM. A
batch equilibrium study led to adsorption
erms for humic acids in distilled water, as
tion of STP concentration and initial pH va
the non-buffered multicomponent system. F
lich isotherms showed an increase in the a
tion capacity of the PAC for humic acids,
decrease in pH and an increase in STP con
tion. The adsorption capacity for humic a
reduced at high pH values in the presence o
in comparison with results obtained with d
water. Electrokinetic measurements of PA
pensions indicates that both humic acids an
induce a negative variation of the zeta poten
carbon particles. In such a binary system, th
potential is a linear function of the pH; the
tive surface charge of the carbon increasin
an elevation of pH. Some adsorption of t
phate polyanion from solution could occur
tributing to the apparent negative surface
of PAC particles. (Moore-IVI)

EVALUATION OF THE ACTIVATED ALUMINA PROCESS FOR FLUORIDE REMOVAL FROM DRINKING-WATER AND SOME FACTORS INFLUENCING ITS PERFORMANCE,
National Inst. for Water Research, Pretoria (South Africa).
J. J. Schoeman, and G. R. Botha.
Water S. A., Vol. 11, No. 1, p 25-32, January, 1985. 5 Fig, 4 Tab, 23 Ref.

Descriptors: *Water treatment, *Fluoride removal, *Drinking water, *Activated alumina, Caustic soda, Alum, Hydrogen ion concentration, Design criteria, Costs.

The activated alumina defluoridation process was evaluated on an underground mine water containing approximately 8 mg/l of fluoride. The objectives of the study were to compare regeneration methods (caustic soda vs. aluminium sulfate (alum)), determine the importance of feedwater pH adjustment (pH 5 to 6) on process performance, establish design criteria for a 518 cu m/d plant, and to determine the economics of the process. Fluoride could be reduced from approximately 8 to less than 1 mg/l. Approximately one and a half times as much product water of a better quality could be produced with caustic soda than with alum as regenerant. Silicate and hydroxyl ions appeared to compete more strongly with fluoride ions for exchange sites when the pH of the feed was greater than 7. This resulted in a much reduced capacity for fluoride removal. The operating fluoride exchange capacity for design purposes was determined at 3.2 g/l alumina and the total defluoridation costs for a 518 cu m/d plant were calculated at R 0.33/cu m of treated water. (Author's abstract)

TRANSFER OF ACTIVE CHLORINE FROM CHLORAMINE TO NITROGENOUS ORGANIC COMPOUNDS. 2. MECHANISM,
Harvard Univ., Cambridge, MA. Div. of Applied Sciences.
R. A. Isaac, and J. C. Morris.
Environmental Science and Technology, Vol. 19, No. 9, p 810-814, 1985. 4 Fig, 4 Tab, 14 Ref.

Descriptors: *Chloramine, *Nitrogen compounds, *Chlorination, Organic compounds, Hydrolysis, Chemical reactions, Chemical kinetics.

In the kinetics of Cl(+) (i.e., active chlorine) transfer from NH2Cl (chloramine) to nitrogenous organic compounds, there are two plausible pathways: hydrolysis, and direct transfer. Transfer of active chlorine from NH2Cl to nitrogenous organic compounds occurs by direct transfer as well as by hydrolysis of NH2Cl which forms HOCl which then can react with the nitrogenous substrates. The nitrogenous compounds investigated fall into two categories: those that form zwitterions and anions and those that form primarily neutral and positive species. In this study, direct transfer was the dominant pathway and involved a second-order reaction - first order in NH2Cl and the nitrogenous substrate. At least two plausible mechanisms can explain the observed data, and a reasonable correlation exists between the absolute rate constants and the basicity of the nitrogenous receptor. Either hydrolysis of NH2Cl or direct transfer of Cl(+) can be the primary pathway depending on the concentrations of the reactants. (Moore-IVI)

HIGH-TECH SOLUTION TO CONTAMINATED DRINKING WATER,
Pirnie (Malcolm), Inc., White Plains, NY.
G. P. Westerhoff, and R. Miller.
Consulting Engineer, Vol. 65, No. 3, p 34-37, September, 1985. 2 Fig.

Descriptors: *Granular activated carbon, *Organic compounds, *Drinking water, *Water treatment, Water treatment facilities, Design criteria, Adsorption, Cincinnati, Ohio.

The nation's first large-scale facility using granular activated carbon is being built to remove a broad spectrum of organic contaminants from the city's drinking water in Cincinnati, Ohio. Cincinnati draws raw water for its California Water Treatment Plant from the Ohio River. The California Water Treatment plant is a typical alum coagulation/rapid sand filter type plant, with flow going from the filters to two large clear wells prior to distribution. A pilot study, conducted in 1977, had as its primary objective the determination of whether GAC was a feasible method for removing trace organics from water while treating it for use as drinking water. While the use of GAC is not new in the US, it has been largely limited to taste and odor control in potable water system filter beds, polishing in wastewater reclamation operations, and in certain industrial processes. Integrating the design of the 175 mgd facility into an existing treatment plant was a challenging task. Special design features and construction features are described. (Baker-IVI)

PRACTICAL, LOW-TECH PLANT ASSURES SUPPLY TO 2010,
Fairfax County Water Authority, Merrifield, VA.
F. P. Griffith, and A. H. Adams.
Consulting Engineer, Vol. 65, No. 3, p 40-43, September, 1985. 1 Table.

Descriptors: *Water treatment, *Water treatment facilities, *Drinking water, Design criteria, Filtration, Disinfection, Potomac River, Fairfax, Virginia.

The James J. Corbalis Water Treatment Plant, in operation in Fairfax, Virginia, is the first step in a program of capital imporvements that will provide adequate and economical water service for the area into the 21st century. This is the first facility in Virginia to use the Potomac River as a source of water supply. These facilities are a principal element of a water supply program now being developed by area water utilities to avert future shortages during periods of drought through coordinated management of available water resources. The plant is a conventional high rate treatment facility that includes the following processes: rapid mixing, flocculations, sedimentation, filtration, fluoridation, and disinfection; finished water storage and pumping; backwash water reclamation; and solids dewatering by plate and frame filter presses. HETEROTROPHIC BACTERIA IN WATER DISTRIBUTION SYSTEMS. I. SPATIAL AND TEMPORAL VARIATION,
Centre des Sciences de l'Environment, Metz (France).
A. Maul, A. H. El-Shaarawi, and J. C. Block.
Science of the Total Environment, Vol. 44, p 201-214, 1985. 6 Fig, 3 Tab, 17 Ref.

Descriptors: *Heterotrophic bacteria, *Water conveyance, *Spatial distribution, *Temporal distribution, Drinking water, Bacteria, Water distribution, Metz, France, Chlorine, Water mains, Retention time, Water temperature.

The drinking water distribution system of the city of Metz in France was sampled intensively during six monthly surveys which were designed to determine the spatial and temporal distribution of total heterotrophic bacteria in the network. A non-hierarchical nearest-centroid clustering method was used for dividing the water distribution system into zones corresponding to different levels of bacterial density. The general pattern of the spatial heterogeneity showed a high degree of reproducibility. Since the frequency distribution of total heterotrophic bacteria within the zones was compatible with

the negative binomial distribution, the water distribution system studied may be considered as being composed of several heterogeneous subsystems. The consistency of this structured spatial dispersion pattern of bacteria in light of some physical and chemical characteristics of the system is evident. In consideration of the principal features of flow in the system relevant to the layout of water mains, the location of zones of highest bacterial concentrations have been attributed to lower levels of chlorine residuals and prolonged retention time of the water in the network, especially in the storage units, before reaching the various distribution areas. Although the monthly variation in the bacterial concentration of the entire system showed a marked increase which was concomitant with warmest water temperatures, the zones were subject to noticeable discrepancies in the range of temporal variation. (Author's abstract)

HETEROTROPHIC BACTERIA IN WATER DISTRIBUTION SYSTEMS. II. SAMPLING DESIGN FOR MONITORING,
Centre des Sciences de l'Environment, Metz (France).
A. Maul, A. H. El-Shaarawi, and J. C. Block.
Science of the Total Environment, Vol. 44, p 215-224, 1985. 3 Fig, 2 Tab, 13 Ref.

Descriptors: *Water quality control, *Monitoring, *Bacteria, *Water conveyance, Drinking water, Water quality, Variability, Sampling.

Information on the spatial and temporal variability of bacteriological data from a water distribution system is used to develop a sampling design for use in future water quality monitoring. The water distribution system is considered to be composed of several zones where the variation of bacterial counts in each zone is modelled by the negative binomial distribution. Under the assumption that the objective of monitoring is to determine whether or not the mean bacterial density of the water exceeds a specific standard, a criterion is given which determines the optimal number of sampling stations allocated to each zone. These stations are determined by assuming that either the risk of sampling is prespecified or that the total number of stations to be sampled is predetermined. Sequential sampling offers another way of monitoring the level of bacterial density in a system. The procedure takes into account the concentration of bacteria in the samples after each collection. 5G. Water Quality Control

APPROACH TO THE RESTORATION OF AQUATIC VEGETATION IN THE XIHU LAKE OF HANGZHOU, WITH REFERENCE TO THE WATER QUALITY PROBLEM (IN CHINESE),
Academia Sinica, Lochiaschan (China). Inst. of Hydrobiology.
C. Hongda.
Acta Hydrobiologica Sinica, Vol. 8, No. 2, p 237-244, May, 1984. 4 Fig, 3 Tab, 8 Ref.

Descriptors: *Lakes, *Xihu Lake, *Hangzhou, *China, *Water quality, *Aquatic vegetation, Phytoplankton, Fish, Lake management, Nutrients, Nitrogen, Phosphorus, Light penetration, Oysters, Mollusks.

The reasons for the deterioration of aquatic vegetation in Xihu Lake were analyzed and the possibility of, and approach to, restoration of the vegetation was investigated with reference to the water quality problem. There were three main causes for the deterioration: the overstocking of plant-eating fish such as Ctenopharyngoden idellus and Megalobrama amblycephala, the rapid growth of phytoplankton, and the deepening of the lake due to artificial removal of sand. Excessive numbers of plant-eating fish destroyed the vegetation by grazing on it. Due to pollution, the water contained large amounts of nitrogen and phosporous. These nutrients, in turn, were taken in by the phytoplankton, causing a rapid increase of these plants. The excessive phytoplankton deprived the underwater plants of their sun energy by blocking the amount of light penetrating the water. Finally, the deepening of the lake could cause a problem by lowering the light intensity at each and different depths. The situation could be remedied by lowering the water level of the lake, thus permitting more light thru; by limiting the number of plant-eating fish; and by planting new vegetation, using both natural and artificial means. After the vegetation was restored, it might prove to be effective in the removal of nitrogen and phosphorous, thus depriving the phytoplankton of their nutrient sources and curbing their growth. A decrease of these plants would allow higher light intensity to reach all levels of water. Study of using aquatic vegetation in purifying water in lakes had never carried out in this country. But yet, as a way of gaining experience, it was highly recommended that such a project should be started hand in hand with the restoration of the vegetation in Xihu Lake. In order to reduce the amount of nitrogen, phosphorous, and phytoplanktons, the stocking of plant-eating fish should be strictly controlled. If it were possible, the types of fish should be chosen in such a way that they mainly graze on the phytoplankton and organic debris. Furthermore, oysters and mollusks should be protected because they also helped to reduce the amount of organic debris and phytoplankton. (Eng-IVI)

A method is presented for estimating the amount of change needed to establish a statistically significant reduction, based on the standard t-test, to nonpoint phosphorus loading in Lake Erie. Analysis of data from the Sandusky River, a north-central Ohio tributary of Lake Erie, indicates that the necessary change is about 35% of the current loads. Assuming that implementation rates will decrease with time, the time spans needed to achieve these changes will differ even more dramatically. Based on projections of implementation rates, a 20% change would require 8 years, but a 35% change would take at least 25 years. Even in cases where best management practices might produce sufficient load reductions for the change to be documented statistically without adjusting the load data for discharge, doing so will allow the change to be documented earlier in the implementation period, and to be more certainly attributed to the best management practices, rather than some other cause. Success in demonstrating a reduction in loads is assisted by a monitoring program which provides sufficient data to calculate loads accurately. Where such programs have been in place long enough to provide a historical database, high priority should be placed on continuing the intensive monitoring effort without change. Otherwise, the changes in sampling strategy will introduce unknown errors and biases into the comparison. This could prevent a real change in loads from being detected statistically, or produce a serious but statistically significant difference where no change in loads had occurred. (Baker-IVI)

Descriptors: *Landfills, *Water pollution control, *Spoil banks, *Cutoff walls, Groundwater pollution, Water pollution sources, Heavy metals, Groundwater barriers, Bentonite, Cement.

The approach channels and canals of major ports must be regularly dredged to keep them at depth. The dredged spoil contains pollutants such as heavy metals, PCBs, and pesticides. When this dredging spoil is disposed of either by landspreading or by landfill, potential pollution problems come into play. The dredging spoil from the sea canal at Ghent in Belgium has been landfilled at a specially engineered site at Zelzate. The landfill was designed to an ultimate capacity of some 2.2 million cu m and occupies a total area of about 30 ha. The depot was excavated in fine sand down to a thick clay layer with a low permeability at approximately 25 m below the surface. With this particular dredging spoil, at the ultimate capacity of the landfill, there will be 5600 tons of toxic heavy metals in the fill. To prevent the spread of pollutants from the site to the surroundings a cement-bentonite screen has been constructed down to a thick clay layer 25 m under the surface. Calculations show that this barrier is adequate for the environmental objectives stipulated. The Zelzate site is one of the first and largest examples of the use of cement-bentonite cut-off walls in the field of pollution control. (Baker-IVI)

ACID RAIN: DOUSING COMMUNITY RESOURCES,
K. Anderberg.
American City and County, Vol. 100, No. 2, p 38, 42-44, 49, February, 1985. 2 Fig.

Descriptors: *Acid rain, *Powerplants, *Emissions, *Water pollution control, Sulfur dioxide, Planning, Management, Decision making, Political aspects, Water conveyance, Water treatment.

While almost everyone acknowledges that there is a problem with acid rain, the area of disagreement is centered around whether action is needed now or whether time can be allowed to pass while more data are gathered on the situation. Uncertainty remains the key word in discussions of acid rain. A recommendation regarding the reduction of sulfur dioxide emissions from coal fired electric power generating stations would have only a minimal effect on electric rates; it would still be highly politicized. For public officials, the problem transcends politics. They must be concerned with public welfare. Europe recognized and began dealing with the problem nearly two decades ago. In the US, forests in New England, Appalachia and California's Sierra Nevada Mountains are exhibiting signs of dead, dying and damaged trees believed to have been caused by acid precipitation. The areas usually affected are far removed from the actual source. Northeastern states have perhaps the greatest concern about acid precipitation's effect on water quality, since water distribution systems in this region often have been in place for decades. The challenge to water system operators focuses on the corrosive water's effect on the distribution system. Highly corrosive or acidic water effects a distribution system in three ways. First there is a health danger associated with higher than recommended levels of heavy metals. Second is the deterioration of pipes and joints that occurs, resulting in leaks, restricted flows and shortened lifespan of the system. The most effective method of protecting consumers from corrosive water and associated contaminants is through corrosion control at the treatment plant. Any emissions control program is likely to be deferred this year. The present administration also appears to prefer to wait for research to be completed before taking any action. (Baker-IVI)

LIMITATIONS OF PHOSPHORUS WATER QUALITY CRITERIA,
Agricultural Research Service, Durant, OK. Water Quality and Watershed Research Lab.
A. N. Sharpley, S. J. Smith, and R. G. Menzel.
Journal of Soil and Water Conservation, Vol. 40, No. 3, p 283-284, May-June, 1985. 6 Ref.

Descriptors: *Eutrophication, *Phosphorus, *Water quality standards, Runoff, Agricultural chemicals, Water quality control, Streams, Lakes, Rain.

The transport of phosphorus from agricultural land in runoff can result in a deterioration of water quality from accelerated eutrophication. Such problems led to the establishment of critical levels for soluble P at 10 micro-g/l and total P at 20 micro-g/l. Results of a water quality monitoring study in Oklahoma and Texas indicate that P concentrations in surface runoff and groundwater from relatively pristine agricultural land were found to be sufficient to stimulate accelerated eutrophication according to the critical-P-concentration guidelines. In addition, P concentrations in rainfall often exceed the critical levels. If runoff and rainfall do not flow directly into an impoundment, soluble P and total P concentration may increase or decrease as a result of release or uptake and erosion or deposition during transport. It may be unrealistic in most cases to attain or maintain P concentration in surface waters below the critical levels. Consequently, the use of these levels as the sole criteria in quantifying permissible tolerance levels of P in surface water as a result of differing management practices should be discouraged. STUDIES ON THE POLLUTION CONTROL OF THE YA-ER LAKE (IN CHINESE),
Academia Sinica, Lochiaschan (China). Inst. of Hydrobiology.
Y. Zhang, Z. Chen, Y. Tan, M. Sun, and D. Zhuang.
Acta Hydrobiologica Sinica, Vol. 8, No. 1, p 113-124, November, 1983. 3 Fig, 4 Tab, 44 Ref.

Descriptors: *Water pollution control, *Ya-Er Lake, *China (Peoples Republic), Pesticides, Oxidation ponds, Biodegradation, Biological wastewater treatment, Aquaculture, Eutrophication, Water reuse, Parathion, Malathion, Dimethoate, BHC.

Ya-Er Lake is located in the west part of E-Cheng county, Hubei Province (Peoples Republic of China. In the past it covered about 6000 ha (now 2000 ha) and was one of the main fish production district in the province. Since 1962 the lake was polluted by wastewater of a chemical plant which manufactured parathion, malathion, dimethoate and BHC. The aquatic ecosystem was ruined. About forty percent of fish population were of abnormal form. After the ecological surveys carried out in 1972-1974, the pollution control of Ya-Er Lake was studied. The research works included: survey of the self-purification of pesticides of the lake, simulation experiment on the processes that would occur in the oxidation ponds, and the biological degradation of pesticides in aquatic environment, etc. The pollution control system of Ya-Er Lake consists of the following parts: 1. Oxidation ponds system. At one end of the lake, four oxidation ponds, connected in series, were constructed. The total area is about 187 ha and 3 m in depth. The retention time of wastewater is about 80 days when the amount of the effluent is 70,000 tons per day. The effluent from the pond system is then discharged into another pond for culturing fingerling fish. Therefore the nutritive elements contained in the effluent can be utilized by the fish and the eutrophication process is retarded in the receiving water body. 2. Sewer pipelines, 5.9 km long, between the chemical plant and oxidation

ponds. 3. Two outfall canals (12.8 km long) which run along either side of the oxidation ponds collect and drain the rainwater into the lake. They are also used as water sources for farming. The above facilities were nearly completed in 1976. The operating experience for four years showed that the system was quite successful in district pollution control. The oxidation pond system can effectively reduce the organic wastes. The average removal efficiences for COD, organic phosphate, p-nitrophenol, parathion, malathion, dimethaote and BHC are 77.3, 82.5, 99.3, 98.7, 98.4, 92.9 and 86.2 percent, respectively. The daily waste-water load was 80,000 tons. Biological survey showed that the biotic community in the Ya-Er Lake ecosystem has been recovering since 1977. The rate of abnormal type of fish decreased to 0.1% in 1979. The BHC residues in fish decreased from 15-30 mg/kg to 0.55 mg/kg (in skeletal muscle). The BHC residues of farm products in 1979 were 2.7-9.4 fold less than those before the construction of the oxidation ponds system. (Author's abstract)

HYDRAULIC CONDUCTIVITY OF TWO PROTOTYPE CLAY LINERS,
Geo-Con, Inc., Pittsburgh, PA.
S. R. Day, and D. E. Daniel.
Journal of Geotechnical Engineering, Vol. 111, No. 8, p 957-970, August, 1985. 13 Fig, 5 Tab, 2 Ref.

Descriptors: *Permeability coefficient, *Clay liners, *Liners, Landfills, Infiltration, Lagoons, Clays.

Two prototype liners were constructed at a site near Austin, Texas, using clays of low and high plasticity. The clays were compacted to 100% of standard Proctor density at a water content slightly wet of optimum using a sheepsfoot roller. The overall hydraulic conductivity (k) of each liner was determined by ponding water on the liners and measuring the rate of seepage. The field-measured k's of the liners were suprisingly high (0.000004 and 0.000009 cm/s). After water in the ponds was removed, laboratory permeability tests were performed on hand-carved samples obtained from the liners, on samples obtained with a thin-walled sampling tube, and on laboratory-compacted samples. Field permeability tests were also performed with ring infiltrometers. The tests showed that: (1) Essentially all of the laboratory tests, even on undisturbed samples, produced a measured k that was approximately 1,000 times less than the field-measured k; and (2) ring infiltration tests showed considerable scatter but the average k was close to the overall field-measured k. The findings raise important questions about whether laboratory permeability tests on compacted clay are relevant to clay liners and reinforce previous suggestions that compacted clay liners may contain numerous hydraulic defects such as fissures, slickensides, zones of poor bonding between clods of clay, and zones of relatively poor compaction. The desirability of field permeability tests is evident from the results reported. (Author's abstract)

Descriptors: *Environmental effects, *Dredging, *Hudson River, *New York Harbor, *Champlain Canal, Spoil disposal, Estuarine environment, Land disposal, Polychlorinated biphenyls, Waste disposal.

The Hudson River is an active commercial and recreational waterway requiring regular maintenance dredging. Disposal of the dredged material and methods of dredging and volume of material removed must be managed in a manner consistent with the level of sediment contamination. Four studies have been undertaken - two in the upper Hudson, and one each in the estuary and in New York Harbor - which evaluate dredge disposal practices appropriate to each region. The use of dredged material from the New York Harbor is being studied to meet the demand for sanitary landfill cover which is in increasingly short supply in the New York area. The study is being conducted for the New York District Corps of Engineers, as an option to ocean disposal. In the estuary, a 10-year maintenance dredging EIS and management plan were developed for the New York District Corps of Engineers. A total of 92 potential upland disposal sites were identified, a portion of which would be suitable for disposal of hazardous waste. In the upper Hudson consideration was also given to the maintenance dredging program conducted by the NYS Department of Transportation on the Champlain Canal. This evaluation will serve as the basis for an environmental impact on the 10 year maintenance program for the canal. In the Upper Hudson a remedial dredging program was developed for the New York State DEC to remove 'hot spots' containing the highest concentrations of PCB. (Author's abstract)

ANALYSIS OF VARIANCES AS DETERMINED FROM REPLICATES VS. SUCCESSIVE SAMPLING,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
E. A. McBean, and F. A. Rovers.
Ground Water Monitoring Review, Vol. 5, No. 3, p 61-64, Summer, 1985. 3 Fig, 9 Tab, 1 Ref.

Descriptors: *Monitoring, *Analysis of variance, *Sampling, Mathematical studies, Groundwater pollution.

Monitoring requirements as specified within the Resources Conservation and Recovery Act rely on increases over background level of the the concentrations of parameters to define when a unit is not in compliance. Evidence of groundwater contamination at a compliance point may be based on statistical comparisons of data from replicate analyses carried out on a single sample. A field test of the variances arising from between samples and within sample replicates indicated that the background concentration is fundamentally important in the statistical significance testing for the compliance point monitoring. Since the variance of the background concentration is best measured by sampling error, as well as analytical error, there is a strong argument that a program of background quality determination should involve successive sampling rather than the splitting of samples into aliquots. OPTIMIZATION MODELING OF WATER QUALITY IN AN UNCERTAIN ENVIRONMENT,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
D. H. Burn, and E. A. McBean.
Water Resources Research, Vol. 21, No. 7, p 934-940, July, 1985. 2 Fig, 2 Tab, 33 Ref, 1 Append.

Descriptors: *Optimization, *Water quality, *Model studies, Probability, Stochastic process, Dissolved oxygen, Wastewater treatment, Simulation, Costs.

A comprehensive approach to water quality modeling could incorporate the stochastic nature of water quality as a means of assuring compliance with probabilistic water quality standards. An optimization model with an ability to reflect uncertainties present in water quality problems is described. The technique employed is chance constrained programming wherein probabilistic constraints in a water quality optimization problem are replaced with their deterministic equivalents. To illustrate aspects of the proposed methodology, a case study is described which involves the determination of the optimal treatment level at two sources in order to satisfy two objectives of maximizing water quality (at a series of four locations) and minimizing treatment costs at the two sources. Water quality is assumed to be represented by the dissolved oxygen concentration in the river. The uncertainty inherent in the random elements of the problem is characterized using first-order uncertainty analysis for the case study. A lognormal distribution provided a satisfactory fit to the distribution of dissolved oxygen deficit. In choosing an appropriate distribution for this problem, consideration should be given to the loading condition and the probability level which is of interest. (Moore-IVI)

COMPUTER AIDED MAPPING PROJECT AIDS SEVERN TRENT,
N. McLeod.
Water Services, Vol. 89, No. 1072, p 161-163, June, 1985.

Descriptors: *Severn Trent Water System, *Mapping, *Computers, Automation, Planning, Water supply, Water distribution, Wastewater facilities, England.

The Lower Severn Division, on of the eight divisions of the Severn-Trent Water Authority (England) supplies water to and treats sewage from 780,000 people. The Division is also responsible for maintaining some 658 km of rivers and estuaries. Lower Severn began investigating computer based mapping in May of 1982. A four person multidisciplinary team was set up, which included two independant consultants. Benchmark tests were established to demonstrate to the prospective user the strengths and weaknesses of the systems competing against each other. From the results of the benchmark tests a three workstation system was selected on an initial one-year rental contract. The mapping software is accurate to 1 mm on the ground and stores data on one of 32 reference files, each of which can have 63 levels. Lower Severn found it difficult to produce a financially sound case to purchase computer equipment for mapping purposes only. Thus it was necessary to exploit the full potential of the system's database capability to produce reports of all kinds. The real payoff will come when all the public utilities and the highway authorities all begin to communicate in specifying a system that will be of benefit to them all, and ultimately of benefit to the paying customers, the consumer. Microcomputer hardware is now well advanced, capable of carrying out most of the tasks required by professional water engineers. By comparison software has not kept pace and only now are program packages becoming available which use facilities to the full. A wide range of programs are available for the simpler tasks but there are still very few available for more complex data handling. The ease of access to microcomputers and their flexibility means that the software for these machines should not be the preserve of computer scientists. Programs should be and are being developed with the emphasis on ease of use but they are not a substitute for technical knowledge. Microcomputers must support the professional engineer, not replace him. (Baker-IVI)

MEASURING VALUES FOR ENVIRONMENTAL RESOURCES UNDER UNCERTAINTY,
New South Wales Univ., Kensington (Australia). School of Economics.
D. R. Gallagher, and V. K. Smith.
Journal of Environmental Economics and Management, Vol. 12, No. 1, p 132-143, June, 1985. 1 Fig, 17 Ref.

Descriptors: *Planning, *Policy making, *Uncertainty, Water pollution control, Environmental protection, Values, Decision making, Risk.

The relationship between conventional measures of the benefits from changes in environmental amenities under certainty and an individual's valuation of such changes under uncertain conditions is considered. The basic framework used in developing the conditions when the Hicksian compensating and equivalent measures of consumer surplus will bound an individual's value for a change in the likelihood of experiencing an improvement in an environmental amenity is introduced. The analysis is conducted within a contingent commodity framework with state-dependent preferences. This approach allows an individual's valuation of a change in access to an environmental amenity to be considered with and without the ability to efficiently allocate risk. This framework is used to evaluate the effects of the allocation of risk on the relationship between an individual's valuation of change in the access conditions and the conventional measures of consumer surplus for certain changes in the amenity resources. The paper concludes by considering the implications of the results for efforts to estimate the values associated with changes in the availability of uncertain environmental amenities. (Baker-IVI)

Group 6A—Techniques Of Planning

HYDROPOWER'S NEWEST GENERATION,
H. Smallowitz.
Civil Engineering, Vol. 55, No. 8, p 46-49, August, 1985. 3 Fig.

Descriptors: *Water resources development, *Hydroelectric power, *Canals, Small hydropower, Planning, Dam construction, Dams, Enviromental effects, Hydroelectric plants.

The Great Falls, Paterson, NJ project is based on a system of canals constructed in the late 1700s to spur small industry in the fledgling US, and develop independence from the economy of Great Britain. While the mills and factories the canals once powered have long since closed, the waterways are still capable of producing 4900 to 11000 Kw. The city of Paterson hopes to make use of this energy source in the future. In North slope, Alaska, the Susitna project is actually made up of two major developments on the Susitna River, some 180 mi North and East of Anchorage. The Eldred L. Field Project, in Lowell, Massachusetts is on a canal system that dates back to 1792. Efforts to make use of this system in modern times necessitated making certain that historical and environmental factors were considered. In Bumcombe County, North Carolina, near Ashville, developers are bringing out of retirement an abandoned hydroelectric plant. The Craggy Dam was originally constructed in 1904. A proposal to tap electricity from the flow of water to Jersey City, New Jersey's water taps is beset with regulatory problems. Plans call for two small hydroplants to be installed at the Boonton Reservoir, 25 mi west of the city. An innovative use of existing mud gates in the reservoir will also make it cost effective to generate 2 Mw more from the facility. (Baker-IVI)

COMPUTER KEEPS NEW ORLEANS' HEAD ABOVE WATER,
Daniel, Mann, Johnson and Mendenhall, New Orleans, LA.
M. A. Ports.
Civil Engineering, Vol, 55, No. 8, p 56-58, August, 1985. 1 Fig.

Descriptors: *Drainage control, *New Orleans, *Louisiana, *Computers, *Drainage systems, Data handling, Storm runoff, Canals, Simulation, Flood peak, Pumping rate.

Drainage problems have beset the city of New Orleans, Louisiana since its founding in 1718. By 1983 it was apparent that an adequate drainage system was necessary. The survey of the topography of the city revealed that the city is saucer shaped. A plan to lift storm water up and out of the city called for an extensive network of canals and pumping stations to Lake Pontchartrain and Lake Borgne. In order to simulate successfully the complex network of interconnected open and covered canals, conduits and pumping stations under both surcharged and free flowing conditions, any potential model must be capable of predicting for each area, for any storm, the time and elevation of peak flows, the maximum pumping rates required to handle peak flows, the above ground flood slopes and the time needed to pump away storm-water runoff. Designers worked to plan the most effective and cost effective improvements. The models for each area were formulated only after testing hundreds of trial simulations. Without the aid of an in-house minicomputer, such a vast array of data would not have been processed with more than 800 simulations completed in only 15 months. (Baker-IVI)

TWO PROJECTS BECOME ONE,
Bureau of Reclamation, Durango, CO.
W. M. Roche, and J. W. Davison.
Civil Engineering, Vol. 55, No. 8, p 64-65, August, 1985. 2 Fig.

Descriptors: *Water resources development, *Multipurpose projects, *Dolores Project, *McElmo Project, *Colorado, Salinity control, Water management, Water supply development, Canals, Linings.

The Dolores and McElmo projects, both near Cortez, Colorado, were begun at different times. The Dolores Project, located in the Dolores and San Juan River Basins was set up to develop water from the Dolores River for municipal, industrial, and irrigation supplies; power; food control; and fish, wildlife and recreation. Just south of the Dolores Project at the McElmo Unit sites, studies were underway to determine the most cost-efficient alternative for reducing salt concentrations. Once preliminary investigations showed that creating a $34 million McElmo Unit that was separate from the Dolores Project would be inefficient, representatives from both projects met to discuss possible joint efforts. The combined project calls for enlarging and lining the Lower Hermana Lateral and Highline Ditch to handle the flows of Towaoc and Rocky Ford canals. Depending on soil conditions and right of way restrictions, either earth, concrete or plastic membrane lining will be used. Design for other portions of the project including canal enlargement and salinity control, will be completed in stages. (Baker-IVI)

PROBABILITY DISTRIBUTION MEMBERS OF A RANKED SAMPLE,
Vsesoyuznyi Gidroproektno-Izyskatel'skii i Nauchno-Issledovatel'skii Inst. 'Gidroproekt', Moscow (USSR).
L. D. Ratkovich.
Water Resources, Vol. 11, No. 3, p 179-185, May-June, 1984. 2 Fig, 3 Tab, 8 Ref. Translated from Vodnye Resursy, No. 3, p 15-22, May-June, 1984.

Descriptors: *Probability distribution, *Autocorrelation, *Time series analysis, Hydrology, Geophysics, Water management,.

When performing hydrologic and water management calculations, it is often necessary to estimate the probability of a particular member of a time series composed of geophysical quantities. The presence of autocorrelation of water-balance components in time series has been proven. Problems remain as to what probabilities the ordinates of a ranked sample of correlated quantities should be referred and what random errors can occur in the case. For a series length of more than 30 members the effect of autocorrelation on the estimates of empirical probabilities of a ranked sample is not evident. Even in this case, when the values of the autocorrelation coefficient are high, the effect of autocorrelation is comparable to the difference between the probabilities calculated by given equations. An equation is also provided for giving a sample estimate of probability with consideration of autocorrelation and is recommended for small samples. Further investigation should be geared toward a theoretical analysis of the distributions of the sample estimates of probabilities of correlated samples and, in particular, a refinement of the confidence limits. Of definite interest is an analysis of the effect of autocorrelation on errors in the estimates of the random variable itself on the basis of the calculated probability values. (Baker-IVI)

HOW TO PUT MORE PUBLIC INTO PUBLIC WORKS,
Black and Veatch, Kansas City, MO.
T. E. Decker, and L. J. Saiger.
Journal of the Water Pollution Control Federation, Vol. 57, No. 7, p 756-762, July, 1985. 4 Fig.

Descriptors: *Public relations, *Education, Public participation, Public opinion, Attitudes, Utilities, Wastewater facilities, Water supply development.

A detailed list is presented of public involvement and education activities and methods that can be used to promote the acceptance of public works facilities, including wastewater and water supply facilities. A brief overview is given of a public participation program for their facilities plan demonstrated that a designed, comprehensive public campaign using standard activities can be successful in many instances. Case histories clearly show that it is occasionally necessary to use very specialized and intensive public relations techniques to educate and satisfy the public. These two case histories prove that public education, involvement, and relations activities are very important at all stages of a project; that words, diagrams, and photographs are not always sufficient to educate individuals about the impact that public works facilities may have on their lives; that the willingness of a municipality or utility to commit money and take the time and effort needed to appease public concerns is usually rewarded; and that, if treated fairly, individuals will generally be willing to compromise and respond positively. The keys to fair treatment are compassion, honesty, imagination, generosity, and perseverance. (Baker-IVI)

SOUTHERN OCEAN AND MARINE POLLUTION: PROBLEMS AND PROSPECTS,
George Washington Univ., Washington, DC. Dept. of Political Science.
C. C. Joyner.
Case Western Reserve Journal of International Law, Vol. 17, No. 2, p 165-194, Spring, 1985. 174 Ref.

Descriptors: *Planning, *Water pollution control, *Marine pollution, *International law, Legal aspects, Marine sediments, Oceans, Natural resources development, Antarctic region.

The nature of marine pollution is examined as it has come to affect global ocean space. An assessment is provided of the extent to which pollutant contamination is presently encroaching upon the Southern Ocean's ecosystem, as well as the possible threates which potential hydrocarbon development in or around Antarctica would likely pose for the circumpolar seas. Finally, an analysis is performed of the various international legal instruments which have been purposefully designed and implemented for curtailing marine pollution. In this connection, specific reference is made to the protection of the Antarctic maritime area. As a result of this analysis, hopefully the environmental degradation associated with marine pollution in the circumpolar region will be better understood and appreciated. More importantly, it is necessary to realize that new, viable, and effective international legal safeguards are imperative if the fragile ecosystem of the Southern Ocean is to be adequately protected and prudently managed. EVALUATING ALTERNATIVE INVESTMENT PROGRAMS FOR THE MEDITERRANEAN-DEAD SEA PROJECT,
Mediterranean-Dead Sea Co. Ltd., Jerusalem (Israel).
A. Gross, and J. Zahavi.
Water Resources Research, Vol. 21, No. 7, p 905-916, July, 1985. 7 Fig, 29 Ref, 1 Append.

Descriptors: *Israel, *Mediterranean-Dead Sea Project, *Evaluation, *Investment, Alternative planning, Optimization, Hydroelectric plants, Economic feasibility, Canals, Tunnels.

The sharp difference in elevation between the Mediterranean and the Dead Sea and the need to replace the water withdrawn from the Dead Sea by water from another source are the key to ambitious Mediterranean-Dead Sea (MDS) project. This project is intended to convey water from the Mediterranean to the Dead Sea via canals and tunnels utilizing the height difference of close to 400 m to generate hydroelectric energy. A methodology, geared toward the prefeasibility study, is devised for evaluating alternative investment programs in the MDS project, which is based on comparing the optimal configuration for each alternative route of the water carrier. The maximal energetic benefits are calculated using two interrelated optimization problems: a multiperiod optimization, involving dynamic programming, to find the optimal operating regime of the system over time, and a one-period optimization, imbedded in the multiperiod optimization, involving probabilistic methods, to find the loading point of the hydro unit that maximizes the value of the energy displaced. Cost-benefit analysis is used to find the optimal size of the hydroelectric components, including the hydro unit size and the water carrier diameter. The model has been applied to evaluate the economic feasibility of the MDS project and to rank the various alternatives by economic merit. The results of this study indicate that the MDS project is viable in all its alternatives with the Central project yielding the largest net benefits. Because the Central alignment introduces many other problems, mainly hydrological, it has been abandoned in favor of the next most economical plan, the Southern alignment. (Moore-IVI)

HYPERGAME ANALYSIS OF THE LAKE BIWA CONFLICT,
Tottori Univ. (Japan). Dept. of Civil Engineering.
N. Okada, K. W. Hipel, and Y. Oka.
Water Resources Research, Vol. 21, No. 7, p 917-926, July, 1985. 1 Fig, 6 Tab, 29 Ref.

Descriptors: *Lake Biwa, *Japan, *Hypergame analysis, *Water allocation, Model studies, Water management, Resource management, Conflict analysis, Decision making.

When there are misunderstandings among participants in a water resources conflict, hypergame analysis can be used to systematically model the conflict and predict the compromise resolutions. In order to demonstrate the efficacy of using hypergame analysis for studying water resources management problems, it is applied to the Lake Biwa conflict in Japan. This dispute constitutes a typical example of a water allocation conflict where downstream users would like more water from the upstream controllers of the major source of the water. Furthermore, each participant or player in the Lake Biwa dispute has misperceptions about the other players' preferences. Besides predicting the different resolutions which each of the players envisioned, hypergame analysis correctly forecasts the compromise resolution that occurred historically. (Author's abstract)

QUESTION OF RATES,
Consumers/Pirnie Utility Services Co., Inc., Hamden, CT.
H. F. Hanson.
American City and County, Vol. 100, No. 6, p 38, 40, 42, June, 1985.

Descriptors: *Economic aspects, *Water rates, Metering, Planning, Management, Utilities, Financing.

Through the years, water utilities have supplied treated water to their customers at the lowest cost, consistent with quality and reliability requirements. This approach has sometimes caused water utilities to become victims of their own success when customers began taking for granted the dependable flow of water at what some consider artificially low prices. Customers and utilities alike are now confronted with the lasting results of this practice. The capital assets of utilities are long-lived, remaining in service for 50 years or more. The initial investments made in the 1930s have not generated sufficient depreciation in funds to finance the replacement or expansion required at today's high construction costs. Suburban expansion of older cities means that more customers must be provided with water over greater distances. New or expanded facilities often must be built to meet expected growth before the customers are in place to pay for service. Two chief problems face water utility managers: how to raise capital, and how to obtain higher rates to pay for the needed improvements. One alternative is the imposition of system development revenues, such as connection fees or cost-of-service charges. Demand rates for utility systems have also received consideration. An emerging technology that will enable utilities to monitor customers' consumption accurately on a frequent basis is automated meter reading. (Baker-IVI)

PAYING FOR REUSE WATER,
CH2M Hill, Inc., Portland, OR. Water and Wastewater Economics.
C. W. Corssmit.
Journal of American Water Works Association, p 78-83, July, 1985. 2 Fig, 1 Tab.

Descriptors: *Water reuse, *Pricing, Cost allocation, Cost-benefit analysis, Water demand, Financial feasibility.

To arrive at satisfactory financing plans and price schedules for reuse water, economic feasibility studies of the proposed projects, including consideration of the no-action alternative, should be undertaken before engaging in more traditional financial planning. This helps to determine the benefits and costs and a proper framework for cost allocations. A market analysis should also be performed to make sure there is a demand for reuse water and to determine what prices people would be willing to pay for it. Typically, revenues obtained from sales of reuse water will be less than for potable water and would possibly not be equal to the cost of serving reuse customers. Methods for redistributing the deficits to other water users are suggested. (Author's abstract)

VOLUMETRIC PRICING OF AGRICULTURAL WATER SUPPLIES: A CASE STUDY,
Texas A and M Univ., College Station. Dept. of Agricultural Economics and Rural Sociology.
R. C. Griffin, and G. M. Perry.
Water Resources Research, Vol. 21, No. 7, p 944-950, July, 1985. 5 Tab, 17 Ref.

Descriptors: *Volumetric pricing, *Irrigation water, *Rice, *Texas, Consumptive use, Econometric models, Economic aspects, Model studies, Pricing.

Models of water consumption by rice producers are conceptualized and then estimated using cross-sectional time series data obtained from 16 Texas canal operators for the years 1977-1982. Two alternative econometric models demonstrate that both volumetric and flat rate water charges are strongly and inversely related to agricultural water consumption. Nonprice conservation incentives accompanying flat rates are hypothesized to explain the negative correlation of flat rate charges and water consumption. Application of the results suggests that water supply organizations in the sample population converting to volumetric pricing will generally reduce water consumption. (Author's abstract)

6D. Water Demand

NILE INSIDE THE SUDAN - INCREASING DEMANDS AND THEIR CONSEQUENCES,
King Saud Univ., Riyadh (Saudi Arabia). Coll. of Engineering.
A. M. A. Salih.
Water International, Vol. 10, No. 2, p 73-78, June, 1985. 2 Fig, 3 Tab, 6 Ref.

Descriptors: *Water resources development, *Water demand, *Nile River, *Sudan, Decision making, Management, Water quality control, Irrigation water, Water management, Environmental effects.

Water budgets of the Nile and its major tributaries have been reviewed and compared with changes in the rate of water abstraction for irrigation purposes in the period starting from Sudan's independence in 1956 to the medium range future. Considerable quantities of the Nile's average annual water budget were to be abstracted for irrigation schemes inside the Sudan in 1977. The effects of these vast abstractions are especially felt, during the low flow season, along many reaches of the Nile and its major tributaries. These abstractions reached 64% of the Blue Nile's average flow during the eight months of the low flow season in 1977. Due to a trend in water use, these effects are expected to worsen in the short and medium term future. Numerous harmful consequences result from these heavy water abstractions, including the neglected rights of the downstream population and the environmental hazards. Reservoir compensation ordinances have existed since 1937 and an Environmental Health Ordinance was issued in 1975. If these ordinances were strictly applied, many consequences would have been reduced or eliminated. Unfortunately these ordinances cannot be effectively implemented due to a lack of monitoring and operational capabilities. They must form an integral part of a comprehensive national water resources management plan. (Baker-IVI)

ETHIOPIAN INTERESTS IN THE DIVISION OF THE NILE RIVER WATERS,
Sanje Zivanovica 9, Belgrade, Yugoslavia.
D. Jovanovic.
Water International, Vol. 10, No. 2, p 82-85, June, 1985. 1 Fig, 1 Tab.

Descriptors: *Nile River, *Ethiopia, *Egypt, *Sudan, *Kenya, *Water demand, Water supply development, Irrigation water, Water resources development, Blue Nile, White Nile, Water management.

The main tributaries of the Nile River are the Blue Nile and the White Nile. The source and nearly the entire catchment area of the Blue Nile are in Ethiopia, while the White Nile basin is shared by several countries. The Nile Water is being used for irrigation, hydropower production, domestic and industrial water supply, navigation, as well as for other purposes. It is likely that Ethiopia will claim about 40 x 10 to the 9th power cu m of Nile water for irrigation. The Nile flow through Sudan and Egypt will be reduced by the same water quantity. Similarly, but on a smaller scale, water used for irrigation in Uganda, Kenya and Tanzania would reduce the White Nile flow. The gain in water after possible reclamation of the Sud and swampy areas also needs to be taken into a Sudan and particularly Egypt need all the they can get and are highly dependent water claimed by the other countries in Obviously a compromise needs to be fou cause if upstream countries maximally satis needs, this could have severe implicatio Sudan and particularly Egypt. It seems t that satisfactory agreement can be achieve near future between all the parties invol order to develop criteria to be used for water division, all countries need to prepare that justify their water demands. Preli agreement on the size, accuracy and standa these studies are needed in order to mak comparable. (Baker-IVI)

vners in LaMoure County construct- drainage ditches from the numerous soughs, and depressions on their 1967 and 1974. This activity caused it in a natural depression on plaintiff Young's land, causing, he charged, damage to his crops and farmland and decreasing the value of his farming operations. Three doctrines of surface water law are applicable. The oldest is civil law rule, which states that the owner of the highland or dominant estate has a natural easement or servitude in the low lying or servient estate, allowing the owner of the dominant estate to discharge all natural waters flowing or accumulating upon his land onto the land of the servient owner. The common enemy rule of surface water suggests a landowner may deal with surface water as he sees fit regardless of the effect on adjoining land. The common enemy rule encourages the full use and exploitation of land. A major flaw is that it forces adjoining landowners to bear the burden of surface water expulsion rather than the landowners who undertake the improvement projects. The reasonable use rule sets forth well defined guidelines including determinations of whether reasonable necessity requires the drainage and balancing the burden against the benefit of the drainage. As this particular case came to trial, it was noted that the plaintiff constructed dams on his own land, thus reducing the gravity of the harm. The trial court denied Young relief because his self-help measures were not legal under section 61-01-07. Moreover, the trial court stated that these self help measures in building dams also precluded Young from recovering under the reasonable use rule. The North Dakota Supreme Court stated that the statements of the trial court were based on an erroneous conception of the reasonable use doctrine. The court also noted that reasonable use should not be confused with negligence or contributory negligence. (Baker-IVI)

EFFLUENT REGULATION AND LONG-RUN OPTIMALITY,
University of Southern California, Los Angeles. Dept. of Economics.
D. F. Spulber.
Journal of Environmental Economics and Management, Vol. 12, No. 2, p 103-116, June, 1985. 1 Fig, 18 Ref.

Descriptors: *Public policy, *Regulations, *Effluents, Standards, Water pollution control, Economic aspects.

A regulator faced with free entry of firms is concerned not only with the implications of public policy for the discharges from a representative firm but also with the total pollution observed at the long run market equilibrium. The long run efficiency properties of regulatory instruments are examined in a multiple input framework. The effluent tax and tradeable permit are shown to be efficient with free entry and exit of small firms. The across-the-board effluent standard results in excessive entry and excessive industry pollution. The results of the study indicate the importance of directing public policy toward pricing the use of the environment. The policy instruments which achieve long run optimality in a competitive market with small firms are the effluent tax and the tradeable effluent permit. Direct intervention through output taxes or output controls, entry tariffs, or restrictions, or effluent constraints will create further distortions in the allocation of resources. Given an effluent charge or permit price equal to marginal social damages, the total of firm payments equals the sum of environmental rent and external damages. These two components provide optimal incentives for entry in the long run. (Baker-IVI)

KEEP YOUR POLLUTION TO YOURSELF: INSTITUTIONS FOR REGULATING TRANSBOUNDARY POLLUTION AND THE UNITED STATES-MEXICO APPROACH,
N. Glickman.
Virginia Journal of International Law, Vol. 25, No. 3, p 693-727, Spring, 1985. 188 Ref.

Descriptors: *Water pollution control, *International law, *United States, *Mexico, Water quality control, Water resources, Legal aspects, International agreements.

The variety of approaches to the control of transboundary pollution that have been tried around the world suggests that there is no simple solution to the ever-increasing international pollution problem. Nevertheless, the willingness of many countries to experiment with novel regulatory schemes bodes well for the future. Although the international law in this area is currently underdeveloped, as more countries submit themselves to specific and enforceable agreements there may well develop a body of customary international environmental law binding on all countries. Until that happens, however, transboundary pollution control will come about only through international agreement. A consideration of the different European and North American approaches to pollution regulation yields several important conclusions. First, that so many countries are beginning to involve themselves in transboundary pollution control represents a positive step in the effort to preserve and protect global natural resources. Second, the wide range of agreements signed in the past twenty years suggests an increasing awareness by the international community that pollution regulation should prevent disasters and not just respond to then. Third, the most effective agreements have been those that either specifically address a narrow problem, or provide a general framework for cooperation and establish procedures whereby the parties can develop solutions to narrow problems as they arise. As defined in the Maryland Coastal Management Program, the state's coastal zone embraces Baltimore City and 16 counties bordering the Atlantic Ocean, Chesapeake Bay and the Potomac River upstream from Washington, D.C. Coastal zone lands may be divided into uplands, tidelands and submerged lands. With some qualifications, Maryland follows the usual rule that property boundaries of lands adjoining tidal waters shift with those gradual, imperceptible physical changes termed accretion and erosion. Unlike courts in other coastal states, the Maryland Court of Appeals has not expansively applied the public trust doctrine, the concept dealing with the public's rights of navigation and fishing in tidal waters. However, the state's high court has recognized public rights in tide covered lands. Public access rights, private littoral rights, and the leasing and regulation of coastal zone lands and waters as currently practiced in Maryland are discussed. (Baker-IVI)

GOVERNMENT SUBSIDIES FOR POLLUTION CONTROL INVESTMENTS - DO OTHER COUNTRIES ENJOY AN UNFAIR ADVANTAGE,
Environmental Resources Ltd., London (England).
R. Bidwell.
Chemistry and Industry, Vol. 85, No. 12, p 395-402, June, 1985. 2 Fig, 6 Tab, 3 Ref.

Descriptors: *Water pollution control, *Political aspects, *Investment, Economic aspects, Subsidies, Industries, Costs, Taxes.

A study was conducted to survey and assess the extent to which government subsidies are made available to industry for pollution control investments in selected countries; to assess the impact that these subsidies have on the net cost to industry of pollution control investments; to assess the extent to which the subsidy schemes conform to the European Community recommendation of 1975; taking account of possible financial assistance, and to determine whether there is evidence that environmental subsidies significantly distort competition. The study identified 36 schemes which might be used to assist industry with pollution control investments. Twenty-eight of these were specifically designed to provide aid for pollution control investments. Four of the schemes focus on particular industry sectors or groups of firms; a number of the schemes focus on particular geographical areas. Eight of the schemes identify research and development as one of their objectives or as their principal objective. Eight schemes were identified that provided general investment aid. These are schemes such as the UK regional allowance or general investment tax allowances that could be used to benefit industrial pollution control investments but which are not specifically designed for that purpose. Pollution subsidies available in the four continental European countries studied, The Netherlands, Italy, Germany, and France, in most cases were designed to assist existing firms with the investment cost of their pollution control plants. The UK does not offer environmental aid of this type. It does make available tax allowances on new investment amounting to around 14%. These environmental assistance schemes are undoubtedly of considerable benefit to firms required to comply with pollution control measures. (Baker-IVI)

Descriptors: *Lake Pontchartrain, *Louisiana, *Salinity, *Canals, Water resources development, Environmental effects, Flow discharge, Lagoons.

Lake Pontchartrain is a brackish water lagoon in southeastern Louisiana. Numerous chemical and physical changes have resulted in this region due to the expansion of the city of New Orleans. The greatest potential for change in the lake arose from the completion of the Mississippi River-Gulf Outlet deep water canal in 1963. While a large increase in salinity of the lake waters was expected, less than half the expected increase actually occurred. The most important factor controlling salinity variations in the lake is discharge. Seventy-four percent of low frequency salinity variations are explained by freshwater discharge and the completion of the deep water canal. Annual variations of salinity are somewhat high in the lake. There has been a die back of freshwater swamps and a retreat of lagoon shorelines, but these are not felt to be a result of the deep water canal completion. (Baker-IVI)

IMPACT OF RIVER CHANNELIZATION; IV. THE ECOLOGICAL EFFECTS OF CHANNELIZATION,
Welsh Water Authority, Nelson. South East District.
M. P. Brooker.
Geographical Journal, Vol. 151, No. 1, p 63-69, March, 1985. 1 Fig, 56 Ref.

Descriptors: *Channeling, *Environmental effects, *Rivers, *United Kingdom, *Channelization, Wildlife, Vegetation, Fish, Invertebrates, Birds.

River corridors (the channel and the immediate local environment) form one of the major linear habitats in the United Kingdom and sustain important wildlife resources. Channelization can result in changes which effect the in-stream and bankside ecology. In general, fish populations are severely affected by channelization, natural channels supporting higher densities, greater biomass and more species, and any recovery is usually slow. The response of macroinvertebrates to channelization is variable but recovery is often rapid. Aquatic vegetation forms an intimate part of the ecology of rivers and streams yet the effects of channalization on in-stream vegetation are poorly documented. Channelization often devastates bankside tree and ground cover. Channelization has a direct impact on riverine birds and, where such works are related to land drainage schemes, changes in water status of the catchment and subsequent land use substantially reduce areas available to breeding and wintering wetland birds. There is a need to describe, more fully, wildlife resources in river corridors, both instream and bankside, and to e their relationships with habitat features in o provide scientifically robust management mendations designed to mitigate the effe channelization. WATER QUALITY EFFECTS OF CLEARCUTTING UPPER COASTAL PLAIN LOBLOLLY PINE PLANTATIONS,
Southern Forest Experiment Station, Oxford, MS. Forest Hydrology Lab.
D. C. McClurkin, P. D. Duffy, S. J. Ursic, and N. S. Nelson.
Journal of Environmental Quality, Vol. 14, No. 3, p 329-332, 1985. 3 Tab, 12 Ref.

Descriptors: *Clear-cutting, *Forest management, *Pine trees, *Water quality, *Environmental effects, *Tennessee, Nitrogen, Phosphorus, Potassium, Nutrients, Soil types.

The effect of clearcutting loblolly pine (Pinus taeda L.) on concentrations of sediment and nutrients in stormflows was studied on small cathchments near Lexington, TN. The plantation were established on eroded and abandoned agricultural lands with fragile soils. Soil series on the catchments include Lexington silt loam (fine-silty, mixed thermic Typic Paleudalfs), Providence silt loam (fine-silty, mixed, thermic Typic Fragiudalfs) and Ruston sandy loam (fine-loamy, silicious, thermic Typic Paleudults). Eight catchments (0.17-0.56 ha) were instrumented with flumes equipped with water stage recorders to measure stormwater and Coshocton wheel samplers to obtain integrated samples of the flow. Plantations on four catchments were clearcut; the other four were left as uncut controls. Stormflow samples were analyzed for sediment total Kjeldahl nitrogen (TKN) and total phosphorus (TP) and solution-phase TKN, TP, and potassium (K). Results indicated that a third or more of the TKN and two-thirds of the TP exported in stormflow from the catchments was via sediment. Solution-phase TKN and TP concentrations in storm-flow were similar on clearcut and control catchments. Solution K concentrations were consistently higher from clearcut catchments. Rainfall inputs of TKN, TP, and K exceeded stormflow losses. The study demonstrated that pine plantations established on fragile soils can be clearcut without significant impact on water quality if recommended practices are used. (Author's abstract)

PERSISTENCE OF STREAM FISH ASSEMBLAGES: EFFECTS OF ENVIRONMENTAL CHANGE,
University of Southern Mississippi, Hattiesburg. Dept. of Biology.
S. T. Ross, W. J. Matthews, and A. A. Echelle.
American Naturalist, Vol. 126, No. 1, p 24-40, July, 1985. 3 Fig, 5 Tab, 60 Ref.

Descriptors: *Fish behavior, *Fish populations, *Environmental quality, *Brier Creek, *Oklahoma, Drought, Temperature effects, Water stress, Brier Creek, Oklahoma, Piney Creek, Arkansas.

Fish assemblage stability and persistence are contrasted in an intermittent, prairie-margin stream (Brier Creek, Oklahoma) and a permanent upland stream (Piney Creek, Arkansas). The duration of the study encompassed three to four turnovers in the populations of most of the species studied and a major environmental perturbation in Brier Creek. Knowledge of temporal stability and persistence of ecological communities is critical to an understanding of the importance of biotic interactions in the maintenance of community structure. Persistence, as indicated by present data, was high for both stream assemblages over approximately one decade. Assemblage stability, as determined from measures of abundance, indicated greater change in the overall fish fauna of Brier Creek than that of Piney Creek. Southeastern Oklahoma had a severe summer drought in 1980 resulting in heat death of fishes in Brier Creek. Although some species were transiently affected, the harsh summer did not have a lasting effect on the Brier Creek fish assemblage overall. Upstream stations subjected to regular summer drying showed greater variability in numerical species ranks within a characteristic suit of upstream species, compared with downstream stations. Station-level changes in both Piney and Brier creeks were significant in several cases, even though the overall fauna of the former did not change significantly in species-abundance ranks. Geographic scale may have had a major effect on the assessment of assemblage stability and persistence. In the absence of detailed knowledge of home ranges of component species, an assessment of assemblage stability should be based on at least several localities within a watershed. (Baker-IVI)

ECONOMIC AND CULTURAL CONSEQUENCES OF LAND LOSS IN LOUISIANA,
Nicholls State Univ., Thibodaux, LA. Dept. of Earth Science.
D. W. Davis.
Shore and Beach, Vol. 51, No. 4, p 30-39, October, 1983. 5 Fig, 71 Ref.

Descriptors: *Wetlands, *Erosion, *Louisiana, Economic aspects, Social aspects, Fishing, Hunting, Recreation, Land use, Farming, Oil industry, Environmental effects, Flood control structures, Drainage.

Louisiana's coastal zone is presently out of balance - a great natural catastrophe is occurring. Land is disappearing. For the entire Louisiana coast, marsh losses in 1980 exceeded 25,000 acres per year. Land building in the deltaic plain has been replaced by a projected rate of loss of approximately 40 sq mi/yr. The land that is eroding at a record rate is a result of sediment deposition associated with the Mississippi River. The construction of flood levees and the dredging of drainage, navigation, petroleum and logging canals upset the sedimentation balance, influence saltwater intrusion and disrupt the natural flow regimes. Landloss forces now supersede constructive forces, thus threatening the jobs, industries and lifestyles of people whose lives are tied directly or indirectly to the coast. Trapping (a multimillion dollar industry), fishing, shrimp harvesting, the oyster industry, menhaden landings, and even recreational use of the waters are threatened. Movement from agricultural ventures to oil industry along the coastal line has brought with it changes in the erosional aspect of the coastal lands. (Baker-IVI)

BIOLOGICAL IMPACTS ON BEACH REPLENISHMENT AND BORROWING,
Coastal Engineering Research Center, Fort Belvoir, VA.
E. J. Pullen, and S. M. Naqvi.
Shore and Beach, Vol. 51, No. 2, p 27-31, April, 1983. 1 Fig, 32 Ref.

Descriptors: *Shoreline, *Beach replenishment, *Environmental effects, Great Lakes, Sand, Benthic animals, Corals, Turtles, Habitats, Fish, Lake shores, Habitats, Dredging.

Shore erosion is a major problem along many ocean beaches and the shoreline of the Great

Lakes. The Corps of Engineers replenishes and nourishes eroding beaches by pumping sand onto the beach. Beach replenishment creates a new habitat that is uninhabited by benthic animals, except for those that may have survived being pumped to the beach with the replenishment sediments or those that survived by vertical migration through deposited sediments. Timing of the replenishment operation may also be a critical factor in reestablishment of benthic animals. Adjustment of benthic animals to replenishment is generally expected since the animals are accustomed to natural disturbances and have demonstrated the ability to recover rapidly. Corals pose a special problem along replenished beaches in Florida. The mobility of fish and some invertebrates render them less vulnerable to the adverse effects of beach replenishment than the nonmotile benthic communities. Destruction of habitat rather than suspended sediment seems to be greater potential problem to fish. Moderate to complete recovery of motile animals will usually occur within less than a year unless a required habitat or food source is permanently lost. Sea turtles are one of the most vulnerable motile vertebrate animals to the effects of beach replenishment. The major physical impact of dredging borrow material is the mechanical disturbance of the substrate and the subsequent redistribution of suspended sediments and turbidity. Potentially, the most serious impacts of offshore dredging are the loss or damage to major commercial species of benthic shellfish, seagrass beds, and corals. Repopulation of a dredged area by benthic animals will depend on the magnitude of the disturbance, the new sediment interface, and the water quality in the borrow pit. (Baker-IVI)

Descriptors: *Clams, *Bioindicators, *Heavy metals, *Kanawha River, *West Virginia, Cadmium, Iron, Metals, Indicators, Zinc, Copper, Manganese.

Two hundred large (16 to 24 mm) Corbicula fluminea individuals were monitored for 10 heavy metals at four different sites (50 clams at each site) on the Kanawha River over a nine week period. Analysis of the viscera revealed silver in the smallest concentrations (between 0.1 and 0.2 micro-g/g) of the metals at all four sites. Cadmium was also found in low concentrations (between 0.2 and 0.4 micro-g/g). Iron was found in the highest concentrations, in some cases surpassing 500 micro-g/g. Magnesium levels were also high, generally ranging between 100 and 200 micro-g/g at all sites. Concentrations of zinc were interesting because of their virtually unchanging levels (approximately 30 micro-g/g) at all four sites over the nine weeks. Copper concentrations were also very constant (between 7.0 and 9.0 micro-g/g) at all sites with the exception of weeks 7 and 9 at Marmet when copper levels reached 17.0 and 12.0 micro-g/g, respectively. While generally low, chromium levels were quite variable, ranging from 0.5 micro-g/g at London, to a high of 12.0 micro-g/g at Glen Ferris. Manganese levels were also quite variable, ranging from a low of 9.2 micro-g/g at Winfield to a high of 100 micro-g/g at London. (Author's abstract)

L. Baoyuan, W. Shida, and H. Deliang.
Acta Hydrobiologica Sinica, Vol. 8, No. 2, p 225-236, May, 1984. 3 Fig, 7 Tab, 11 Ref.

Descriptors: *Water pollution, *Bioindicators, *Zoobenthos, *Xiang Jiang River, China (Peoples Republic), Species diversity, Mayflies, Indicators, Water pollution effects.

Studies on zoobenthos in the Xiang Jiang River were carried out five times between July, 1980 and December, 1981. Artificial substrate was used for sampling in all stations in the river, especially the heavily polluted area between Zhuzhou and Xiangtan. Based on the data obtained from the survey, the Shannon diversity index was calculated and used for the biological evaluation of water quality of the river. The relationship between the number of zoobenthos and the chemical content was also calculated in some stations. Results show that the mayfly naiads are more sensitive to heavy metals and pesticides and may be used as monitors for water pollution in the river. The percentage of ephemeropterans and trichopterans as compared with that of the other aquatic insects used for water monitoring was also determined. In nearly all stations the diversity indices were more than 2.11, except the Xiawan station, where the index was only 0-0.73. (Author's abstract)

SLEEVE AND CASING LYSIMETERS FOR SOIL PORE WATER SAMPLING,
Wisconsin Univ.-Madison. Dept. of Soil Science.
R. Morrison, and J. Szecsody.
Soil Science, Vol. 139, No. 5, p 446-451, May, 1985. 4 Fig, 2 Tab, 16 Ref.

Descriptors: *Lysimeters, *Pore water, *Water sampling, *Sleeve lysimeters, *Casing lysimeters, Particle size, Monitoring wells, Wells.

Two pore water samplers were designed for the purpose of incorporating a lysimeter into the casing of a monitoring well and to provide multiple sampling capabilities in a single retrievable section. A sleeve lysimeter was fabricated for use with a monitoring well and provided multiple sampling points to depths of about 15 m. The casing lysimeter provides multiple sampling points to depths in excess of 15 m by incorporating several lysimeters with threaded PVC well casing. minimum vertical distance between the porou tions of two lysimeters was calculated us linearized solution of the matric potentia steam functions for various soils at finite an nite depths. A vertical spacing not less th times the lysimeter radius (20 r sub 0) is app ate for most soils. The radius of sampling infl is maximized if the borehole diameter is slightly larger than the lysimeter, and a grained silica flour (grain size 0.032 mm) is for an optimum backfill around the porous s of the lysimeter. Journal of Irrigation and Drainage Engine Vol. 111, No. 2, p 125-133, June, 1985. 5 F Ref.

Descriptors: *Irrigation scheduling, *Water *Plant physiology, Soil water, Cotton, C temperature, Petioles, Crop yield.

Plant stress utilizing crop temperature unde conditions may be quantified utilizing a crop stress index (CWSI). Petiole water conte canopy temperature of cotton were used as tors of stress in cotton. Air temperature w fined as the value obtained with an aspirate psychrometer at the time canopy temperatu measured each afternoon. Canopy tempe were taken daily about an hour past solar four looking east and four looking west, do rows. Solar radiation was measured with a sensor each minute and integrated into an basis, ultimately yielding daily totals. Petiole content was measured daily by weighing p and determining the weight difference afte oven dried for 24-hrs. Crop yield was ob from each plot using a standard cotton pic CWSI using remotely sensed canopy tempe was a better indicator of plant stress tha petiole water content. This point was most c when using these parameters as a potential t scheduling irrigations and for estimating lint yield prior to harvest. Petiole water conte not possess the sensitivity of a CWSI for as crop stress. PWC involves a labor intensi structive plant sampling procedure which data for a single plant part, whereas a C derived from a measurement that surveys plants. For a rapid assessment of crop st schedule irrigation and estimate yield, it appropriate to use the CWSI. (Collier-IVI)

ll extraneous mineral particles from the
and moss samples. Bioconcentration oc-
all waters but increased hydrogen ion
tions in the water were associated with
metal concentrations in the bryophytes.
dependence between Al and H(+) con-
was demonstrated in the Loch Ard
eam water samples; the maximum con-
of Al in a stream with pH 6.62 was 25
compared with 400 micro-g/l in a stream
nnual mean pH of 4.43. The seasonal
n Al concentration which occured in the
stream had a maximum concentration of
-g/l in February, which declined rapidly
o-g/l in May (1980); this sharp decrease
with a prolonged dry spell with low
ich resulted in a rise in stream pH and a
duced leaching of Al from the catch-
ease of aluminum, manganese and zinc
ryophytes by hydrogen ions may make a
contribution to the loadings of these
id waters. While the pH remains above
netals such as Al and Mn are taken up
d by the bryophyte. At lower pH values
ir of metal ions may be released into
water. It is possible that a sharp drop in
release sufficient trace metals to exceed
sholds for fish and other organisms.

REPLACEMENT OF THE TELEMETRY SYSTEM OF THE SUNDERLAND AND SOUTH SHIELDS WATER COMPANY,
R. T. Heslop.
Journal of the Institution of Water Engineers and Scientists, Vol. 39, No. 3, p 231-237, June, 1985. 2 Fig.

Descriptors: *Telemetry, *Water conveyance, Water management, Water distribution, Planning, Automation, Monitoring, Water quality, Water treatment.

A telemetry system is described as it was applied to the Sunderland and South Shields Water Company which currently supplies 140 ml/d of water to a population of 554,000 in the 342 sq km area covering the coastal strip south of the river Tyne to just north of Hartlepool, England. Originally the 23 principal outstations were linked by rented land line omnibus circuits to the Company. The 25 minor outstations were linked to the nearest principal outstation by direct land line conveying data from the satellite in analogue form. Early proposals for the replacement of the master station involved the use of purpose-built computers designed by the telemetry manufacturer. The original intention was to retain the original outstations, but the cost of providing a special director unit required to enable original outstations to communicate via the omnibus circuits with the new master station was very high. Thus it was decided to replace the original hard wired outstations with CMOS equipment. The use of the telemetry system has long since progressed from the simple activity of monitoring. Presently the Company uses its central control functions and infomation in matters of waste prevention and efficient source utilization. Projected applications of the system are in the following areas: dynamic network analysis of the distribution network; waste location, assessment, and prevention; trunk main management; monitoring of flow meters, efficiency service intervals and optimized locations; pressure zoning and control; water quality distribution and zoning, including effects of system alterations on the processes of sensitive industrial consumers; complaints monitoring and management; control of use of fire hydrants; system chlorination control; discolored water preventive measures; control of animal infestation in mains; correlation of rainfall and hydrological data; pollution of souces; monitoring of groundwater well levels and correlation with source output; and groundwater source interaction and correlation. STRIPPING ANALYSIS AND CHROMATOGRAPHIC SNIFFING FOR THE SOURCE IDENTIFICATION OF ODOROUS COMPOUNDS IN DRINKING WATER,
Linkoeping Univ. (Sweden). Dept. of Water in Environment and Society.
R. Savenhed, H. Boren, and A. Grimvall.
Journal of Chromatography, Vol. 328, p 219-231, June, 1985. 4 Fig, 5 Tab, 27 Ref.

Descriptors: *Pollutant identification, *Organoleptic properties, *Stripping analysis, *Chromatographic sniffing, Odors, Water pollution sources, Water analysis.

Chemical and sensory methods have been combined into an improved technique for the source identification of odorous compounds in drinking water. A simple device for gas chromatographic sniffing, in which the capillary column is lead to the odor observer via heated copper tubing, has been developed. This system is highly sensitive and highly accurate for the determination of retention times. A stripping technique that permits high stripping temperatures without technical problems has also been developed, and it has been shown to increase significantly the number of odorous compounds detected by column sniffing. The design of the stripping system gives a very low blank level that results in almost no compounds detected on column sniffing of extracts from odor-free water. Odor profiles from a river basin with discharges from agriculture, industry and municipalities are presented. Special attention has been given to the effects of pulp mill discharge, and it is shown that they are mainly of local importance with regard to odorous compounds. (Author's abstract)

FACTORS REQUIRING RESOLUTION IN INSTALLING VADOSE ZONE MONITORING SYSTEMS,
Woodward-Clyde Consultants, Santa Ana, CA.
G. A. Robbins, and M. M. Gemmell.
Ground Water Monitoring Review, Vol. 5, No. 3, p 75-80, 1985. 3 Fig, 1 Tab, 5 Ref.

Descriptors: *Vadose water, *Monitoring, *Pollution detection, *Aeration zone, Path of pollutants, Fate of pollutants, Waste disposal, Wells, Lysimeters, Vapor probes, Tensiometers, Conductivity.

Increasingly, regulations by federal, state and local agencies are being developed that require the installation of vadose zone monitoring systems for hazardous chemical facilities in addition to, or in lieu of, conventional groundwater monitoring wells. Compared to a ground water monitoring approach, vadose zone monitoring systems may permit earlier detection of chemical leakage and less costly cleanup of contamination. The effective use of vadose zone monitoring systems in detecting contamination dependes on many factors. Without proper consideration of these factors, a vadose zone monitoring system may not give as high a level of reliability as a groundwater monitoring system. Major factors to consider in installing a vadose zone monitoring system are: type of instrument to use, number of instruments, depths and location of instruments, and frequency of monitoring. Means to evaluate these factors in a comprehensive fashion have been lacking. Based on recent experience in installing and operating vadose zone monitoring systems, criteria and methods useful in resolving the preceeding factors have been developed. Types of instruments can be classified as either direct (lysimeter, vapor probe) or indirect (tensiometer, conductivity probe). A combination of the two is needed for reliability. The depth, location and number of instruments depend on the geometry of the facility, the number and size of likely contaminant leakage points in engineered barriers, properties of the material being monitored, the effective radius of monitoring for each instrument, vadose zone properties, and types of remedial actions that are available. The frequency of monitoring largely depends on the rate of movement of the contaminant. Evaluating the preceding

factors requires some level of modeling and preliminary field testing. (Author's abstract)

Descriptors: *Indium, *Chemical analysis, *Electrothermal Atomic Absorption Spectrometry, *Atomic absorption, *Trace metals, *Sediments, *Fly ash, Palladium, Metals, Spectrometry.

Due to the low levels of indium found in minerals and rocks, analyses have depended on neutron activation and spark-source mass spectrometry. A method is described for the determination of indium (10-40 micro-g/g) in lead-zinc ores and magnetic pyrites. Graphite furnace atomic absorption spectrometry is used with palladium as a matrix modifier. Indium (down to 0.085 micro-g/g) in river sediments and coal fly ash can be determined after pre-extraction with ammonium iodide into 4-methyl-2-pentanone. The low sensitivity for indium was assumed to be due to the vaporization of molecular species of indium during the pre-atomization stages, and efforts were made to find suitable matrix modifiers which might prevent such a vaporization loss. Of several metal salts tested for this purpose, palladium was shown to be the best modifier, although all metals tested at least doubled the sensitivity. The indium absorbance in the absence of matrix modifier obtained after ashing at 600 C was used as a baseline against which the enhancement properties were measured. In the presence of palladium, the maximum tolerable ashing temperatures for indium in aqueous solution or organic extract can be raised to 1200 C or 1000 C, respectively. The sensitivity is improved by a factor of three compared to that obtained for pure aqueous indium solutions. It is assumed that the addition of palladium stabilizes indium by forming more thermostable compounds or alloys and decreases the formation of volatile species such as InO, thus enhancing the atomic absorbance. Descriptors: *Water quality, *Monitoring, *Remote sensing, Water quality control, Evaluation, Measuring instruments, Computers.

One of the most important problems of monitoring inland water bodies is to obtain a prompt determination of the water quality. Quick methods of observation are needed by means of which the actual state of water masses, elements of their dynamics, presence of wastewaters in water bodies, routes of their spreading, and other parameters can be determined. A set of remote-sensing apparatus meeting these indicated requirements has been developed and is undergoing testing. A description is given of the various parts of the system including the resistance thermometer, conductometer, oximeter, water transparency meter, and the meter used to determine the depth of submergence of the group of sensors. Further improvements are expected to be accomplished by increasing the number of measured physical and chemical characteristics through the addition to the set of new sensors for a more reliable identification of water masses in the basin and through the conversion of the recording of the measured parameters to a form convenient for input into a computer and also the possibility of transmitting the information over a radio channel. The solution of these problems will considerably increase the promptness of monitoring water bodies. (Baker-IVI)

RADIO-TELEMETRY AS AN AID TO ENVIRONMENTAL CONTAMINANT EVALUATION OF MOBILE WILDLIFE SPECIES,
Battelle Pacific Northwest Labs., Richland, WA.
L. E. Eberhardt, and L. L. Cadwell.
Environmental Monitoring and Assessment, Vol. 5, No. 3, p 283-289, September, 1985. 2 Fig, 17 Ref. DOE contract DE-AC06-76RLO 1830.

Descriptors: *Telemetry, *Wildlife, *Radioactive wastes, Remote sensing, Monitoring, Radioactive waste disposal, Waste ponds, Ducks, Deer, Hanford, Washington.

Programs monitoring wildlife species for environmental contaminants from localized sources can maximize the amount of information obtained from an individual animal by using radio-telemetry to ascertain residence history. The use of radio-telemetry techniques on two mobile wildlife species, mule deer (Odocoileus hemionus) and mallard ducks (Anas platyrhynchos), to document their use of and movement from low-level radionuclide contaminated waste ponds are described. The study was conducted on or near two man-made waste management ponds located approximately in the center of the Hanford Site in southcentral Washington. Both ponds, which now support dense stands of aquatic and riparian species, receive effluent water from chemical and waste processing plants associated with the nuclear facilities. Radiotelemetry techniques provided the opportunity to ascertain the residence history of highly mobile wild animals and to select those few individuals for sampling that have a known residence history within the area of interest. Radio-telemetry techniques can provide data on the extent, direction or location, and seasonality of movement by mobile wildlife species that may aid in interpreting potential impact to consumers (man) from ingestion pathways. STABILITY OF THE ZHITOMIR CELLULAR BUTTRESS DAM,
V. I. Zeryukov, and S. I. Karlin.
Hydrotechnical Construction, Vol. 18, No. 11, p 533-537, November, 1984. 4 Fig, 1 Tab. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 11, p 15-18, November, 1984.

Descriptors: *Abutments, *Butress dams, *Dam stability, Overflow dams, Cellular construction, Reinforced concrete, Dam construction, Monitoring.

The Zhitomir overflow dam, constructed in 1962-1965 on the Teterev River on the western outskirts of Zhitomir city, has been in operation for more than 15 years. The hydraulic structures include a precast reinforced-concrete overflow cellular buttress dam with a standard-shaped head, abutments, and a 1-m-diameter dewatering pipe outlet enclosed in the left-bank abutment. Ten cracks were found in the abutments, of which 8 were in the right-bank abutment and 2 in the left-bank abutment. Visual inspections of the Zhitomir overflow dam in 1980 showed that during its operation the negligible cracks that appeared have not affected the strength of the structure. As a rule, all cracks were due to temperature effects. In order to improve monitoring of the condition of hydraulic structures, it is recommended that they be equipped with measuring instruments such as height markers and piezometers. (Keenan-IVI)

DESIGN CRITERIA FOR RESERVOIR BOTTOM OUTLETS,
Technische Univ. Muenchen (Germany, F.R.). Inst. fuer Wasserbau.
H. Blind.
International Water Power and Dam Construction, Vol. 37, No. 7, p 30-32, July, 1985. 6 Fig.

Descriptors: *Design criteria, *Reservoirs, *Outlets, Drawdown, Dam construction, Reservoir operation, Dam design, Flood control.

Based on experience, the provision of a bottom outlet in a dam is generally necessary. The bottom outlet, in addition to serving the purpose of normal reservoir emptying, should be designed to provide adequate discharge capacity for operational conditions such as emptying the reservoir for emergency repair work. According to the requirements and limitations of the scheme, the capacity of a bottom outlet can vary considerably. If enough discharge structures are available, the capacity of the bottom outlet can be kept relatively small. An essential factor to consider is the desired time for emptying the dead reservoir storage. Should large discharge structures be available, it will be necessary to install a very efficient bottom outlet for operational and safety reasons. The possibility of drawing down the water level rapidly in case of damage to the dam or within the storage area can be very important. In addition it might be necessary, for repair work, to have an additional outlet available during drawdown. In recent years these aspects have been taken into account at many dam projects throughout the world. According to operational characteristics, the size of the dam and its storage volume as well as inflow and outflow quantities, bottom outlets with capacities of up to 500 cu m/second have been constructed. Designers are advised to examine and determine carefully and conscientiously the arrangement and capacity of a bottom outlet. (Baker-IVI)

WATERPROOF ELEMENT FOR EMBANKMENT DAMS,
A. D. M. Penman.
International Water Power and Dam Construction, Vol. 37, No. 7, p 33-36, 41-48 and 112, July, 1985. 17 Fig, 2 Tab, 42 Ref.

Descriptors: *Embankments, *Earth dams, Clay, Concrete, Rolled concrete, Construction, Walls, Membranes, Cutoffs, Dam cores.

The purpose of the waterproof element for embankment dams is to limit the flow of water so that material is not carried away, and so that the downstream drains can cope with the flow to ensure that porewater pressures do not exceed design assumptions. This overview looks at developments in techniques over the years for the construction of the waterproof element for embankment dams. Homogeneous dams, central clay cores (puddled clay cores and rolled clay cores), central core walls (concrete, asphalt, and plastic concrete, upstream membranes (concrete, asphalt, thin sheets), below ground cutoffs (grout curtain, diaphragm walls), and the connection between a dam and an underground cutoff are each discussed. Consorzio Acque per le Province di Forli e Ravenna (Italy).
P. P. Marini, and F. Bavestrello.
International Water Power and Dam Construction, Vol. 37, No. 7, p 52-56, July, 1985. 7 Fig, 2 Tab.

Descriptors: *Ridracoli Dam, *Italy, Dam construction, Rocks, Dam foundations, Sandstone, Rock mechanics, Gravity dams, Arch dams.

The Ridracoli Dam (Italy) is of the concrete gravity-arch type and was completed in the spring of 1982. The dam has a rock foundation of alternating layers of marl and sandstone. The structural and mechanical characteristics of this rock caused problems during excavation as a danger was foreseen of rock layers slipping along the bedding planes. Detailed studies were therefore required, including lab tests, to ensure that stability would not be jeopardized by excavations for the dam. Work on the dam began in 1975 and took about seven years to complete, three of which were spent solely on extensive base excavations. The pouring of the concrete began in the summer of 1978 and was completed in the spring of 1982. The operation to stabilize the excavations and the work of sealing and consolidating the foundation rock were carried out under a sub-contract. (Baker-IVI)

The Sadd-el-Kafara dam was investigated in detail for the first time in 1982. The dam was constructed in the era of the Old Egyptian Empire, about 1600 BC, and represents the first attempt at storing water on a large scale. The purpose of the dam was apparently to protect installations in the lower wadi and in the Nile valley from the frequent and sudden floods following heavy rainfalls. The dam, by modern standards, is stable and would have withstood the floods reasonably to be expected if it had been completed. A flood during the construc-

tion period appears to have led to destruction, followed by a catastrophic flood wave. Construction was abandoned. The design was basically correct and the dam was adequately protected from damage caused by water bypassing the dam on the left bank or overtopping. Thus it was a tragedy that an unexpected flood created such a disaster. Even after 4500 years and on the basis of all present day knowledge and experience, the greatest respect must be paid to the Egyptian engineers for having the courage to construct the dam with the limited technological means and scarce scientific knowledge at their disposal. POWER CONDUITS FOR HIGH-HEAD PLANTS; PART TWO,
Innsbruck Univ. (Austria). Inst. fuer Konstruktiven Wasserbau und Tunnelbau.
G. Seeber.
International Water Power and Dam Construction, Vol. 37, No. 7, p 95-98, July, 1985. 5 Fig, 15 Ref.

Descriptors: *Dam construction, *Power head, *Design criteria, Construction, Dams, Conduits, Pressure tunnels, Shafts, Tunnels, Linings.

The criteria which govern the selection of the technique used to line a power conduit are assessed. The increasing number of high-head storage and pumped-storage schemes built during the past quarter of a century has called for a more critical assessment of the relative benefits of the various methods of lining pressure tunnels and shafts. Applications are given for the following methods: concrete lining plus seal; concrete lining plus thin steel seal; and thickwalled steel linings. In the case of peak load power stations with marked fluctuations in dynamic pressure, special emphasis must be place on engineering and installing the lining with an eye to achieving optimum fatigue strength. In particular, one must take care to avoid notches, sudden changes in thickness, obstacles to expansion, and compound stress. (Baker-IVI)

FLOW CHARACTERISTICS OF THE HYDRAULIC JUMP IN A STILLING BASIN WITH AN ABRUPT BOTTOM RISE,
Ecole Polytechnique Federale de Lausanne (Switzerland). Dept. de Genie Civil.
W. H. Hager, and R. Sinniger.
Journal of Hydraulic Research, Vol. 23, No. 2, p 101-113, 1985. 11 Fig, 17 Ref.

Descriptors: *Hydraulic jumps, *Flow characteristics, *Stilling basins, Hydraulic properties, Fluid mechanics, Jets.

The flow characteristics in prismatic stilling basins with an abrupt rise of the channel bottom are analyzed. Proper accounting for the pressure distribution at the step leads to an expression for the conjugate flow depths in terms of the in flow Froude-number and the relative step height. It is found that the pressure distribution just in front of the step is not hydrostatic but must be augmented by the dynamical pressure head. For a given energy head and Froude-number at the upstream zone of the stilling basin, the dissipated energy is independent of the step height and corresponds to the value of a hydraulic jump on a horizontal bottom. For a given inflow Froude-number, transition between hydraulic jump and jet formation over the step depends on the relative step height. For vertical steps sweeping out and refilling of the stilling basin occurs at identical downstream conditions, whereas downstream flow depth must be higher for refilling when the step is positively inclined. The length of the roller and the jump are slightly longer in stilling basins with positive steps than for ordinary hydraulic jumps on horizontal bottoms. The present study allows a simple and rapid determination of all pertinent design quantitites for stilling basins consisting of an abrupt bottom rise. (Baker-IVI)

PREDICTION OF CHARACTERISTICS FOR VERTICAL ROUND BUOYANT JETS IN STABLY LINEAR STRATIFIED ENVIRONMENT,
Wuhan Inst. of Hydraulic and Electric Power Engineering (China).
W. Li, and C. J. Chen.
Journal of Hydraulic Research, Vol. 23, No. 2, p 115-129, 1985. 9 Fig, 15 Ref.

Descriptors: *Turbulent flow, *Buoyance, *Stratification, *Jets, Model studies, Hydraulic models, Water pollution, Turbulence, Heat flux, Shear stress, Kinetic energy.

The vertical turbulent buoyant jet discharging into a linear stratified environment is one of the most important and basic flow patterns related to environmental pollution. A turbulent model is used to study the behavior of round buoyant jets before the point of neutral buoyancy in stably linear stratified environments. The calculation of the center line velocity, density, turbulent kinetic energy, half-width of buoyancy jets and the profiles of turbulent kinetic energy, turbulent shear stress and turbulent heat flux are made for exit densimetric Froude numbers of 1.0 and 450.0 and strengths of stratification S = 0.0-0.11. A unified scaling law in non-uniform environments is derived for normalization of these results. The correlation of the predicted results shows that the established zone of buoyant jets in the stably linear stratified environment may be similarly divided into three regions for the uniform environment namely non-buoyant region, intermediate region, and plume region. The variation of centerline velocity, density and turbulent kinetic energy along the axial line for both uniform and linearly stratified environments is shown to fall into a single curve under the scaling law derived. The predicted results are compared with the experimental data with fair agreement. The spread of velocity half-width along the axial line for different strengths of stratification in a given exit densimetric Froude number converges to a single curve under the unified scaling law. Unlike the spread of velocity half-width the spread of temperature half-width first spreads and then converges near the established zone for the case of small ambient temperature gradients. For large ambient temperature gradients the spread tends to be convergent. The dimensionless mean velocity profile in the zone of established flow for different exit densimetric Froude numbers and strengths of stratification may be approximated by a Gaussian profile, and the dimensionless mean temperature profile can be expressed in two segments by two Gaussian profiles. The turbulent field does not reach the state of self-similarity at the location closed to the point of neutral buoyance. The predicted results of dimensionless turbulent transport properties are given at two locations for different exit densimetric Froude number. At each location the predicted results are shown to converge into a single curve for different ambient strengths of stratification. (Baker-IVI)

PLANE TURBULENT BUOYANT SURFACE JETS AND JUMPS,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
N. Rajaratnam, and S. Subramanyan.
Journal of Hydraulic Research, Vol. 23, No. 2, p 131-146, 1985. 7 Fig, 1 Tab, 17 Ref.

Descriptors: *Turbulence, *Jets, *Hydraulic jumps, *Fluid mechanics, Richardson numbers, Froude numbers, Buoyance, Surface jets, Entrainment.

Based on an experimental study of plane turbulent buoyant surface jets, the distinction between surface jets and surface jumps has been sharpened. For the surface jet, the growth of the thickness of surface jet in terms of the jet thickness at the outfall with the dimenionless longitudinal distance for a wide range of source Richardson numbers has been evaluated. The structure of the mean velocity in the surface jet has also been studied for a range of Richardson numbers. For surface jumps with supercritical densimetric Froude numbers as large as about 9 there is hardly any entrainment on its lower side. The dimensionless surface pro
the surface jump is the same as that of the
familiar open channel hydraulic jump. The
velocity field in the surface jump has also
studied. A comprehensive diagram has been
oped to predict whether a surface jet, or
jump or drowned jump will occur for given
ardson numbers and the downstream de
stratified flow in terms of the source thic

l. 129, No. 7, p 49-50, July, 1985. 3 Fig.

: *Cavitation, *Pumps, *Mathematical Synergetic geometry, Model studies, puters,.

n pump cavitation can involve the fre-scribed classical forms on impeller or ess well known localized phenomena. techniques of analysis which can permit n of flow models that are simultaneous-, interactive and predictive concerns a bscure branch of mathematics, called geometry. A computer model of a a cavitation problem was created. The water in the space from the low pres-to the low pressure header was divided nient units called DROs. Each DRO number and all were observed from a the system, so that they appeared to be n accordance with the laws of syner-etry, the DROs formed into certain the pressure, temperature, or velocity eir volume changed, and consequently changed. The computer then identified rahelical patterns, in which tetrahedra n corkscrew chains by the sharing of a adjacent pair of tetrahedra. The com-dentified all patterns upstream of the until it had identified octal flow for a wo pipe diameters. The problem then and steps for a solution were under-nicircular vane was installed two pipe-pstream of the inlet; with the vane e cavitation and vibration ceased.

VORTEX TOWER FOR THE EL CAJON SPILLWAY INTAKE,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaziologie.
D. Schulthess.
International Water Power and Dam Construction, Vol. 37, No. 7, p 27-30, July, 1985. 8 Fig, 4 Ref.

Descriptors: *Hydraulics, *Vortex towers, *Intakes, *El Cajon, *Honduras, Spillways, Fluid mechanics, Flow, Model studies.

There is a risk that the gates around the intake zone at the El Cajon Dam, Honduras, could be damaged by the high velocity vortices. With partial gate openings, it is quite likely that logs that have been sucked in by a vortex will cause further damage by colliding with the gates. Further, air bubbles can expand under the gate lips and create instabilities in the uniform flow causing pressure fluctuations with large peaks. Some devices for the prevention of vortex formation have been described earlier. In a way, the vortex tower functions in a similar manner to an injector, and can be used to prevent vortex formation in a large secondary flow region. Tests have been performed with such a vortex tower, and these indicated that vortex formation is able to be controlled for a spillway intake of 1800 cu m/sec capacity. The tower, which has a diameter of 8 m and a height of 20 m, is at present being constructed. At the maximum storage level the tower is submerged by 8.5 m. Flow through the tower accounts for about 10% of the discharge through the spillway. (Baker-IVI)

ENERGY APPROACH TO ESTIMATING SCOUR DOWNSTREAM OF A LARGE DAM,
Vancouver (British Columbia).
K. J. W. Spurr.
International Water Power and Dam Construction, Vol. 37, No. 7, p 81-89, July, 1985. 6 Fig, 3 Tab, 52 Ref.

Descriptors: *Scour, *Estimating, *Dam, Fluid mechanics, Water flow, Design criteria, Plunge pools, Spillways.

The prediction of scour is presented for estimating the equilibrium scour downstream of large dams is necessary to ensure the safety of the toe of the dam as well as stability of its abutments. To assess plunge pool scour accurately, the influence of the spillway layout, the spill duration, the geology and the relative rates of scour developent between the outer pool and the live-scour hole must be taken into account. A rationalized, indexed approach is presented for estimating scour downstream of large dams in terms of the mean surplus jet power and rock threshold energy levels. Although the method proposed could have been more usefully illustrated had the necessary equilibrium spill times, hydraulic and geological data at another large dam been available for checking, this approach offers an advantage over previous procedures. MECHANICAL EQUIPMENT OF THE DNESTER MULTIPURPOSE HYDROPOWER DEVELOPMENT,
M. V. Beketov, Ya. S. Oservaser, and B. A. Fedorov.
Hydrotechnical Construction, Vol. 18, No. 11, p 525-528, November, 1984. 3 Fig. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 11, p 10-12, November, 1984.

Descriptors: *Mechanical equipment, *Dam construction, *Hydroelectric plants, Cranes, Gates.

The Dnester multipurpose hydropower development located on Dnester River in the Chernovtsy region is intended for power generation, irrigation, water supply, and flood control. The mechanical equipment employed was designed with consideration of its use in the construction period and has a number of distinctive characteristics. The construction of a trestle with the service gantry cranes on the gated wall of the upper pool made it possible to operate the gates before construction was completed, which provided start-up of all units on time. Unlike the traditional designs, these cranes have two-legged portals and the grabs have a sectional construction. This made it possible to reduce the weight by 203 tons. The use of service gates during construction eliminated the construction of additional temporary flashboards and corresponding consumption of metals. The use of structural elements of the concrete-buggy trestle of the Sayano-Shushenkoe hydrostation instead of the earlier specified reinforced-concrete elements of the bridge and crane beams considerably simplified fabrication and shortened the assembly time. The timely design developments for the mechanical equipment in the construction period, correlated to the actual conditions at the construction site, made it possible to accomplish the assembly works in the shortest possible time. M. M. Mamazhonov, and A. I. Denisov.
Hydrotechnical Construction, Vol. 18, No. 11, p 544-553, November, 1984. 10 Fig, 1 Tab, 6 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No. 11, p 22-27, November, 1984.

Descriptors: *Cavitation, *Turbidity, *Pumps, *Abrasion, Hydraulic machinery, Turbines, Suspended sediments, Suction head, Costs.

On-site observation of the operation of hydraulic machines and long experience in operating stations and pumping stations show that abrasive and cavitation-abrasive wear play the main role in the failure of parts of hydraulic turbines and pumps operating on streams with high turbidity. Data is presented which was derived from an experimental facility designed to study the combined effects of cavitation and abrasion due to sediments on failure of hydraulic turbines and pumps. A definite effect of solid particles on the development of cavitation phenomena was found. General principles of selecting the permissible cavitation margin or permissible suction head from the viewpoint of minimum wear rate of pump parts are established. This in turn will impact upon the capital investments required for the construction of pump units. (Keenan-IVI)

Descriptors: *Noise, *Hydraulic equipment, *Water conveyance, Mechanical equipment, Design criteria,.

There are practical cost effective solutions to combat the problem of noise generated in the water industry due to the movement of water by various mechanical devices. Noise related problems fall into two distinct categories, occupational and involving the employees; and community involving the neighbors. Case studies reveal that even the most difficult projects can be engineered for noise control. These results are not achieved by luck, they are planned for and designed for. When faced with a noise problem whether occupational or community the water authorities can have confidence in the performance of noise reduction and acoustic treatments. (Baker-IVI)

Descriptors: *Cavitation, *Multistage orifices, Orifices, Erosion control, Water flow, Fluid mechanics, Hydraulics.

A multistage orifice is essentially a series of sharp-edged orifices installed in a line. It prevents cavitation by gradually reducing the pressure. If designed properly, it is highly effective, inexpensive and easy to fabricate when compared to other sophisticated devices. Two types of multistage orifice design are considered. The first type is constant-cavitation index design, and the second is constant-orifice diameter design. The first type of design is to determine the number of orifice stages with such a constant cavitation index so that the given upstream and downstream pressure heads are satisfied. For this case, the pressure drop across an orifice and the orifice diameter will vary from stage to stage. The second type of design utilizes a constant orifice diameter for all orifices and allows the cavitation index to vary. (Baker-IVI)

COMPACTION CHARACTERISTICS OF RIVER TERRACE GRAVEL,
Ottawa Univ. (Ontario). Dept. of Civil Engineering.
V. K. Garga, and C. J. Madureira.
Journal of Geotechnical Engineering, Vol. 111, No. 8, p 987-1007, August, 1985. 15 Fig, 6 Tab, 12 Ref.

Descriptors: *Compaction, *Gravelly soils, *Construction materials, *Earth dams, *Dams, Permeability, Particle size, Soil types, Soil properties.

Gravelly soils consisting of sound gravel-size particles in a matrix of finer material have proved to be a satisfactory construction material for several large earth dams. The gravel fraction of these soils imparts a relatively high shear strength, high compacted density and low compressibility, while the permeability of the soil is governed by the properties of the matrix material. Large-scale field and laboratory tests were carried out to investigate compaction characteristics of a river terrace gravel soil at the 120-m high Sao Simao Dam in Brazil where approximately 10,000,000 cu m of this material were used as compacted fill. The course fraction of the deposit was typically 3 in. (7.5 cm) maximum size, while the matrix (defined as material passing No. 4 sieve) was basically a clayey sand with LL = 30-35%, PI = 5-15 and 35-50% passing the No. 200 sieve. Field compaction trials were carried out to establish procedures for embankment construction and to evaluate the efficiency of two vibratory rollers. The maximum density for a specific compaction effort was obtained at a gravel content of 65-70%. Shockley's expression for maximum density is not valid for gravel content greater than 25%. The particle size does not significantly affect compaction for gravel content in the 40-60% range for the equipment used in this study. The measured densities are insensitive to the gradation of the gravel fraction. Field compacted density control can be exercised satisfactorily by using elimination and substitution methods: In the substitution method, the plus 3/4 in. fraction size is substituted in a sample by an equal percentage of minus 3/4 in. to plus No. 4 sieve size fraction, and compacted using the intermediate energy; in the elimination method, only the minus 3/4 in. size fraction in a sample is compacted using the standard Procter energy. Descriptors: *Earth dams, *Dam construction, Rollers, Vibrators, Construction, Earthworks, Construction equipment.

The placement of materials in the dam is the main factor determining the rate of construction in the cyclic production-line technology used for construction of the earth-rock dam at the Rogun hydrostation. Because the geotechnical characters of the materials being used at the Rogun hydrostation are similar to those of Nurek dam, the experience of constructing the dam at the Nurek hydrostation is the basis for recommendations on the parameters and technological operating regimes of vibrating rollers and on the organization of the next investigations for advanced development of the optimal technology for construction of the earth-rock dam at the Rogun hydrostation. To increase the rate and reduce the work time for placing materials in the Rogun dam it is necessary to provide intensive methods of placing the earth materials in layers > 1 m thick with rolling speeds up to 4 km/h and reduction of the number of passes with overlapping by using effective vibrating machines. It is necessary to be oriented mainly towards the use of medium (5-10 tons) and heavy (10-15 tons) mobile vibrating rollers. The parameters and technological operating conditions of the rollers should be refined based on the results of experimental rolling. (Shieh-IVI)

LIQUEFACTION OF FINE SAND DUE TO WAVE ACTION,
Universidad Nacional Autonoma de Mexico, Mexico City. Facultad de Ingenieria.
L. Zeevaert.
Shore and Beach, Vol. 51, No. 2, p 32-36, April, 1983. 6 Fig.

Descriptors: *Liquefaction, *Sand, *Waves, *Grijalva River, *Mexico, Erosion, Jetties, Clay, Subsidence, Sediment transport, Erosion.

In connection with an investigation for the construction of two new long jetties at the mouth of the Grijalva River in order to permit safe navigation to reach the Port of Frontera in the State of Tabasco, Mexico, liquefaction in fine sand was also studied. Subsoil investigations indicated a surface deposit of about 5 mts thick of the fine sand with a mean diameter ranging between 0.15 and 0.20 mm. From 10 to 29.5 mts depth a thick bluish-gray clay deposit with microscopic shells was encountered and is underlain by gray silty snd with small shells. The average water content of the clay deposit is about 55% and is practically constant with depth. The shearing strength of the clay deposit, between 10 and 29.5 mts depth, was obtained from unconfined compression tests and showed an erratic value, probably because of the strong difference in the salinity of the water during the process of sedimentation and flocculation of the fine grains. The large subsidence of the rock jetties found may be attributed only to the simultaneous action of spontaneous liquefaction and base erosion. Instantaneous liquefaction may be visualized as a pumping action produced by the waves in the fine sand at the toe of the jetty, permitting a gradual subsidence of the rock into the sand up to a depth where the effective stress in the sand is greater than zero. The water flow at the foundation grade elevation of the jetty facilitated the transport of the fine sand, permitting the spreading of the rock slope of the jetty because of the reduction in the foundation support. OF ANNUAL DRAINING ON UALITY AND PRODUCTION OF CATFISH IN PONDS,

v., AL. Dept. of Fisheries and Allied
es.
rman, and C. E. Boyd.
, Vol. 46, No. 1, p 45-54, May, 1985. 5
16 Ref.

*Aquaculture, *Catfish ponds,
aining, *Fish farming, Catfish farming,
y, Chlorophyll a, Phosphorus, Chemi-
demand, Nitrates, Nitrites, Ammonia,

ns of chlorophyll a, total phosphorus,
xygen demand, nitrite-nitrogen, total
rogen, and dissolved oxygen were
equently in channel catfish ponds, of

which four were drained annually and four were not drained for 3 years. Average concentrations of total phosphorus increased from year to year in undrained ponds, and they were higher ($P < 0.01$) in undrained ponds than in drained ponds during the second and third years of the study. Phytoplankton abundance, as evident from chlorophyll a concentrations, did not differ ($P > 0.05$) within or between treatments during the 3 years. Water quality was similar between treatments. One difference in production of channel catfish occurred during the third year and was related to a parasite infection of fish rather than water quality. The findings suggest that the recent trend in not draining channel catfish ponds at harvest will not lead to rapid deterioration of water quality in ponds. (Author's abstract)

FACTORS AFFECTING GROWTH AND RECRUITMENT OF YELLOW PERCH, PERCA FLAVESCENS MITCHILL, IN SOUTH BAY, LAKE HURON,

Ontario Ministry of Natural Resources, Toronto. Lake Huron Fisheries Research Unit.
B. A. Henderson.
Journal of Fish Biology, Vol. 26, No. 4, p 449-458, April, 1985. 2 Fig, 3 Tab, 17 Ref.

Descriptors: *Perch, *Lake Huron, *Recruitment, *Growth, Lakes, Population dynamics, Water temperature, Water level, Fish populations.

Several hypotheses were tested which explain the large variations in recruitment and growth observed in yellow perch. The five hypotheses are: recruitment is positively correlated with water temperature; recruitment is a function of parental stock-size; recruitment is a function of water levels; growth is related to population abundance; and growth is dependent upon water temperature. The ratio of recruits to spawners was principally determined by variations in water levels, which presumably reflected the effect of variations of the quality and quantity of spawning substrates on egg or fry survival. The recruitment was then dependent upon the combination of stock-size and the survival of the eggs or fry. Thus, good recruitment could only be achieved if a large parental stock size produced eggs that survived well. In recent years, the parental stock-size in South Bay was small, but the survival was good; as a result, the recruitment was relatively poor compared with the earlier years when both parental stock-size was large and early survival was high. There was no indication that recruitment and the ratio of recruits to spawners was dependent upon stock density; therefore, a stock-recruitment relationship did not exist. Variations in R/P were a function of water levels and not parental stock-size. Growth was not dependent upon water temperatures, but was affected by population abundance. The number of recruits, and not the total population size determined the rate and increment of growth. The implication is that competition for food takes place between perch of a similar size and age. The environment determined the ratio of recruits to spawners, and the population size affected growth. (Baker-IVI)

RESERVOIR FISHERY RESEARCH NEEDS AND PRIORITIES,

Tennessee Valley Authority, Chattanooga.
G. E. Hall.
Fisheries, Vol. 10, No. 2, p 3-5, March-April, 1985. 17 Ref.

Descriptors: *Fisheries, *Management, *Reservoir fisheries, Operation, Planning, Reservoir operation, Fish stocking, Water quality, Surveys, Research priorities.

In surveys conducted in 1983 and 1984 approximately 80 professional fisheries biologists with reservoir experience were asked to furnish information and ideas on gaps in current reservoir knowledge, pressing needs for additional information, appropriate directions for research and the kind of organization best suited to conduct a reservoir fisheries program. Knowledge gaps identified by the largest number of respondents in both surveys were: the absence of a clear understanding of predator/prey interactions; need for information on optimum stocking procedures; knowledge of factors affecting the recruitment of fish; and information concerning impacts of harvest regulations on individual species and population balance. Highest priorities for needed information concerned a better knowledge of water quality/fish interactions and the ability to predict impacts of reservoir drawdowns and/or water level fluctuations plus more information on proven reservoir management techniques. The majority of respondents thought the development of models for managing reservoir problems should receive the greatest attention. Over 90% of the survey respondents considered reservoir research to be a federal responsibility. Although most of the respondents felt that reservoir research was a federal responsibility deserving national attention, there is a lack of concensus concerning how it should be funded and administered. MANAGEMENT OF LACUSTRINE FISHERIES IN THE TROPICS,

Cornell Univ., Ithaca, NY. Dept. of Natural Resources.
R. T. Oglesby.
Fisheries, Vol. 10, No. 2, p 16-19, March/April, 1985. 2 Tab, 15 Ref.

Descriptors: *Fish management, *Reservoirs, *Tropical regions, Resources management, Fish populations, Fisheries, Developing countries, Regional development.

Lake and impoundment fisheries of many developing countries have the potential to provide accessible, relatively inexpensive animal protein in quantities approaching a hundred kilograms per hectare of surface per year. These fisheries in the lowland tropics currently yield an average catch of 80 kg/ha/hr. There are two kinds of harvest limitations: those imposed by constraints on fish production and those resulting from underdevelopment of fisheries. A first, critical step in the management of these fisheries is to predict potential yields and to compare them with current harvests. Site specific management programs can then be developed by taking into account stocking, assistance to fishermen, data collection and analysis, and program evaluation. Most impoundments now being built or planned in developing countries are primarily for the production of power and the storage of water for crop irrigation. Fisheries are an add-on and their management becomes complicated by the presence of trees not removed during site preparation and extreme water level fluctuations that occur both seasonally and between years. Inclusion of fishery personnel in making operation decisions as well as in initial planning activities may result in substantially improved fishery development oppor-

tunities. Management of lake and impoundment fisheries in developing tropical countries is at an early stage but seems to be evolving rapidly. (Collier-IVI)

Effect of Toluene on Fathead Minnow (Pimephales promelas Rafinesque) Development,
W86-01892 5C

FENS
Development of a Treed Bog Island in a Minerotrophic Fen,
W86-01630 2L

FERRITIN
Identification of Ferritin as a Major High Molecular Weight Zinc-Binding Protein in the Tropical Rock Oyster, Saccostrea cuccullata,
W86-01406 5C

FERTILIZATION
Streamflow Nitrogen Loss Following Forest Fertilization in a Southern Vancouver Island Watershed,
W86-01784 5B

FERTILIZERS
Effect of the Content of Organic Matter in Soil on Leaching of Chemical Fertilizers into the Zone of Aeration and Groundwaters,
W86-01822 5B

FINANCIAL ASPECTS
Training: The Bridge Between Treatment and Technology,
W86-01489 5D

FINITE ELEMENT METHOD
Comparison of the Results of Calculating Unsteady Flow in the Enisei Mouth Stretch by the Finite-Difference and Finite-Element Methods,
W86-01802 2E

FINLAND
Assessment of Pollution History from Recent Sediments in Lake Vanajavesi, Southern Finland. I. Selection of Representative Profiles, Their Dating and Chemostratigraphy,
W86-01365 5B

Assessment of Pollution History from Recent Sediments in Lake Vanajavesi, Southern Finland. II. Changes in the Chironomidae, Chaoboridae and Ceratopogonidae (Diptera) Fauna,
W86-01366 5B

FIR TREES
Estimation of Twig Xylem Water Potential in Young Douglas-fir Trees,
W86-01781 2I

Needle Water Potential and Soil-to-Foliage Flow Resistance During Soil Drying: A Comparison of Douglas-fir, Western Hemlock, and Mountain Hemlock,
W86-01787 2I

FIRTH OF CLYDE
Effect of Temperature on the Growth of Planktonic Larvae of Tellina tenuis da Costa,
W86-01603 5C

FISH
Anthropogenic, Polyhalogenated, Organic Compounds in Sedentary Fish from Lake Huron and Lake Superior Tributaries and Embayments,
W86-01347 5B

Effects of Contaminants on Toxicity of the Lampricides TFM and Bayer 73 to Three Species of Fish,
W86-01349 5C

Effects of Environmental and Biological Variables on the Toxicity of Mercuric Chloride,
W86-01353 5C

Investigations on Paraquat Toxicity in Fishes,
W86-01378 5C

Comparative Acute Sensitivities of Early Life Stages of Atherinid Fishes to Chlorpyrifos and Thiobencarb,
W86-01408 5C

Effect of Lethal Copper Solutions on the Behavior of Rainbow Trout, Salmo gairdneri,
W86-01410 5C

Hudson River PCB Relationships Between Resident Fish, Water and Sediment,
W86-01554 5C

Density, Growth and Annual Food Consumption of Plaice (Pleuronectes platessa L.) and Flounder (Platichthys felsus (L.)) in Lake Grevelingen, The Netherlands,
W86-01577 2H

Organochlorine Pesticides and Polychlorinated Biphenyls in Sediment and Fish from Wetlands in the North Central United States,
W86-01651 5C

Chlorinated Hydrocarbons and Hatching Success in Baltic Herring Spring Spawners,
W86-01799 5C

Variability of Aluminum Concentrations in Organs and Whole Bodies of Smallmouth Bass (Micropterus dolomieui),
W86-01872 5A

Bioconcentration Factors of Some Halogenated Organics for Rainbow Trout: Limitations in Their Use for Prediction of Environmental Residues,
W86-01874 5C

Contaminant Residues in Fish and Sediments from Lakes in the Atchafalaya River Basin (Louisiana),
W86-01890 5B

Contaminants in Fish from Great Lakes Harbors and Tributary Mouths,
W86-01891 5B

Activation of Polycyclic Aromatic Hydrocarbons by Hepatic S-9 from a Marine Fish,
W86-01896 5C

Effect of Selenite on the Uptake of Methylmercury in Cod (Gadus morhua),
W86-01901 5C

FISH BEHAVIOR
Effect of Lethal Copper Solutions on the Behavior of Rainbow Trout, Salmo gairdneri,
W86-01410 5C

Quantitative Chemobehavior of Fish: An Improved Methodology,
W86-01509 5A

Behavioral Modification of Estuarine Fish Exposed to Sulfur Dioxide,
W86-01679 5C

Persistence of Stream Fish Assemblages: Effects of Environmental Change,
W86-01756 6G

Avoidance Test of a Fish, Medaka (Oryzias latipes), to Aquatic Contaminants, with Special Reference to Monochloramine,
W86-01888 5A

FISH FARMING
Effects of Annual Draining on Water Quality and Production of Channel Catfish in Ponds,
W86-01322 8I

FISH FOOD
Possibilities of Obtaining Zooplankton from the River Plonia to Feed Young Fish,
W86-01320 2H

FISH MANAGEMENT
Management of Lacustrine Fisheries in the Tropics,
W86-01600 8I

FISH MIGRATION
Water Temperature as the Primary Influence on Timing of Seaward Migrations of Atlantic Salmon (Salmo salar) Smolts,
W86-01589 2H

FISH PARASITES
Characteristics of Fish Helminth Fauna in Some Water Bodies of the North Dvina Basin under Conditions of an Altered Water Regime,
W86-01816 2H

FISH POPULATIONS
Reconstruction of Long-Term Time Series for Commercial Fisheries Abundance and Estuarine Pollution Loadings,
W86-01331 5C

Investigation of Relationships Among Pollutant Loadings and Fish Stock Levels in Northeastern Estuaries,
W86-01332 5C

Assessing Habitats Used by Warmwater Stream Fishes,
W86-01599 2H

Persistence of Stream Fish Assemblages: Effects of Environmental Change,
W86-01756 6G

FISH TISSUES
Six Ponds Dioxin Survey,
W86-01551 5C

PCBs: Dietary Dose and Burdens in Striped Bass From the Hudson River,
W86-01555 5C

FISHERIES
Reconstruction of Long-Term Time Series for Commercial Fisheries Abundance and Estuarine Pollution Loadings,
W86-01331 5C

Discrimination of the Stock of Fish (Eels, Anguilla rostrata) Based on the Presence of the Synthetic Chemical Mirex (Discrimination d'un Stock de Poisson, l'Anguille (Anguilla rostrata), Basee sur la Presence d'un Produit Chimique de Synthese, le Mirex),
W86-01584 5C

Reservoir Fishery Research Needs and Priorities,
W86-01598 8I

FJORDS
Exchange of Water in Fjords: The Efflux/Reflux Theory of Advective Reaches Separated by Mixing Zones,
W86-01536 2L

FLASH DISTILLATION
Selection of Small Desalination Plants for Specific Locations - Reverse Osmosis, Flash Distillation, Vapour Compression,
W86-01672 3A

FLATFOOT CREEK
Life History and Ecology of the Alderfly, Sialis aequalis Banks, from Flatfoot Creek, Mason County, West Virginia,
W86-01595 2H

FLEXIBLE DAMS
Note on the Shapes of Flexible Dams,
W86-01394 8A

FLINT POND
Six Ponds Dioxin Survey,
W86-01551 5C

FLOCCULATION
Flocculation, Precipitation, Sedimentation and Flotation for use as Pretreatment Stages for Brackish Water and Seawater in Desalination Plants,
W86-01370 3A

Modeling the Effects of Hydrolyzed Aluminum and Solution Chemistry on Flocculation Kinetics,
W86-01617 5F

FLOOD CONTROL
Impact of River Channelization; II. Channelization: Some Engineering Aspects,
W86-01402 4A

Phytoplankton Primary Production in Brackish Lake Grevelingen (SW Netherlands) During 1976-1981,
W86-01570 2H

Sadd-el-Kafara: the World's Oldest Large Dam,
W86-01693 8A

FLOODS
Physicochemistry of the Upper Gila River Watershed: II. Influence of Precipitation Runoff and Flood Events on the San Francisco River,
W86-01358 2K

Southland Flood of January 1984,
W86-01388 2E

Year of World Wide Extremes; Floods and Droughts,
W86-01427 2B

Effect of Flood Conditions on the Groundwater Quality of a Borehole at Baroda near Cradock, Eastern Cape Province,
W86-01860 5B

FLORIDA
Abundance of West Indian Manatees (Trichechus manatus) around Selected Florida Power Plants following Winter Cold Fronts, 1982-1983,
W86-01758 5C

FLOTATION
Flocculation, Precipitation, Sedimentation and Flotation for use as Pretreatment Stages for Brackish Water and Seawater in Desalination Plants,
W86-01370 3A

Russian Use of Flotation for Wastewater Treatment,
W86-01736 5D

FLOW CHARACTERISTICS
Flow Characteristics of the Hydraulic Jump in a Stilling Basin with an Abrupt Bottom Rise,
W86-01391 8B

FLOW MECHANICS
Experimental Measurements of Multiple-Jet Induced Flow,
W86-01530 8B

FLOW-PUMP METHOD
Low Gradient Permeability Measurements in a Triaxial System,
W86-01450 2G

FLUID DROPS
Effects of Drop Size Distribution Truncation on Rainfall Integral Parameters and Empirical Relations,
W86-01534 2B

FLUID MECHANICS
Plane Turbulent Buoyant Surface Jets and Jumps,
W86-01393 8B

FLUIDIZED BEDS
Inhibition of Calcium Sulfate Deposition
Fluidized Bed,
W86-01369

FLUORESCENCE
Effect of Seawater Magnesium on Natural
rescence During Estuarine Mixing, and Im
tions for Tracer Applications,
W86-01801

FLUORIDE REMOVAL
Evaluation of the Activated Alumina P
for Fluoride Removal from Drinking-Wat
Some Factors Influencing its Performance,
W86-01859

FLUORINATED BIPHENYLS
Identification of New, Fluorinated Biphen
the Niagara River-Lake Ontario Area,
W86-01621

Catalytic Effect of Various Metal Ions on the Methylation of Mercury in the Presence of Humic Substances,
W86-01607 5B

HYDRAULIC EQUIPMENT
Noise in the Water Industry,
W86-01633 8C

HYDRAULIC JUMPS
Flow Characteristics of the Hydraulic Jump in a Stilling Basin with an Abrupt Bottom Rise,
W86-01391 8B

Plane Turbulent Buoyant Surface Jets and Jumps,
W86-01393 8B

HYDRAULIC PROPERTIES
Hydrogeophysical Model for Relations Between Electrical and Hydraulic Properties of Aquifers,
W86-01653 2F

HYDRAULIC STRUCTURES
Ways to Improve the Technology of Constructing Concrete Hydraulic Structures,
W86-01622 8F

HYDRAULICS
Vortex Tower for the El Cajon Spillway Intake,
W86-01689 8B

HYDROCARBONS
Background Levels of Dissolved/Dispersed Petroleum Residues in the Gulf of St. Lawrence, 1970-79,
W86-01588 5B

Trace Metals and Hydrocarbons in Sediments from the Southampton Water Region, with Particular Reference to the Influence of Oil Refinery Effluent,
W86-01797 5B

Effect of Hydrocarbon Mixtures on Adsorption of Substituted Naphthalenes by Clay and Sediment from Water,
W86-01852 5B

Bioavailability and Biotransformation of Aromatic Hydrocarbons in Benthic Organisms Exposed to Sediment from an Urban Estuary,
W86-01873 5B

HYDROCHEMISTRY
Multivariate Analysis and Interpretation of the Hydrochemistry of a Dolomitic Reef Aquifer, Northern Italy,
W86-01773 2F

HYDRODYNAMIC MODELS
Turbulent Flows Over a Wavy Bed,
W86-01537 2E

Formation of Ripples in Erodible Channels,
W86-01538 2J

HYDRODYNAMICS
Phytoplankton and Nutrient Dynamics in Saline Lake Grevelingen (SW Netherlands) under Different Hydrodynamical Conditions in 1978-1980,
W86-01568 6G

HYDRODYNAMICS

Investigation of the Hydrodynamic Problems of Seepage and Convective Diffusion in Inhomogeneous and Anisotropic Porous Media,
W86-01818 2F

HYDROELECTRIC PLANTS
Lower Mae Ping Project, Thailand,
W86-01374 6B

Mechanical Equipment of the Dnester Multipurpose Hydropower Development,
W86-01624 8C

HYDROELECTRIC POWER
Hydropower's Newest Generation,
W86-01739 6A

HYDROGEN ION CONCENTRATION
Effects of pH and Plant Source on Lignocellulose Biodegradation Rates in Two Wetland Ecosystems, the Okefenokee Swamp and a Georgia Salt Marsh,
W86-01413 2L

Low pH Tolerance Under Continuous-Flow Bioassay Conditions of Hellgrammite Larvae, Corydalus cornutus L. (Megaloptera: Corydalidae),
W86-01597 5C

Impact of Alkaline Particulates on pH of Rain Water in India,
W86-01606 5B

Evaluation of Mathematical Models for the Effects of pH and Temperature on Ammonia Toxicity to Aquatic Organisms,
W86-01648 5C

HYDROGEOLOGY
Estimation of the Degree of Drainage of a Territory,
W86-01821 2G

HYDROLOGIC BUDGET
Determination of Growing Season Soil Water Deficits on a Forested Slope Using Water Balance Analysis,
W86-01786 2A

HYDROLOGIC CYCLE
Macroscopic Estimation of Available Water Resources in Kagoshima Prefecture, Japan (in Japanese),
W86-01604 2A

HYDROLOGIC MODELS
Hydrology of Mid-Altitude Tussock Grasslands, Upper Waipori Catchment: II - Water Balance, Flow Duration and Storm Runoff,
W86-01384 2A

Probability-Distributed Principle and Runoff Production at Point and Basin Scales,
W86-01449 2E

HYDROLOGIC SERIES
Correlation Between Sample First Autocorrelation Coefficient and Extreme Hydrologic Runs,
W86-01666 2A

HYDROLOGY
Maximum Likelihood Parameter Estimation of Hydrologic Spatial Processes by the Gauss-Newton Method,
W86-01656 2A

Hydrological and Hydrochemical Aspects of the Transformation of Organic Matter in the Mozhaisk Reservoir,
W86-01812 2H

HYDROLYSIS
Atrazine Hydrolysis in Soils: Catalysis by the Acidic Functional Groups of Fulvic Acid,
W86-01907 5B

HYDROMORPHIC SOILS
Nitrogen Mineralization in a Sequence of Hydromorphic Soils in a Valley in the High Semois (Belgium) (Mineralisation de l'azote dans une sequence de sols hydromorphes de la vallee de la Haute Semois (Belgique)),
W86-01510 2G

HYDROUS MANGANESE OXIDE
Role of Mn(2+)-Rich Hydrous Manganese Oxide in the Accumulation of Arsenic in Lake Sediments,
W86-01645 5B

HYPERGAME ANALYSIS
Hypergame Analysis of the Lake Biwa Conflict,
W86-01762 6B

HYPERTENSION
Sodium in Drinking Water in South Carolina,
W86-01411 5C

ICE
Role of Liquid Water on an Ice Surface During Riming Electrification - Basic Experiment in Thunderstorm Electrification,
W86-01528 2C

Sampling of Snow and Ice on Lakes,
W86-01788 2C

ICE STORMS
Ice Storm Damage to a Southern Wisconsin Mesic Forest,
W86-01760 2C

IMAGE PROCESSING
Use of Aerial Photography and Image Processing to Measure Dye Dispersion from a Long Sea Outfall,
W86-01518 7B

IMSA RIVER
Water Temperature as the Primary Influence on Timing of Seaward Migrations of Atlantic Salmon (Salmo salar) Smolts,
W86-01589 2H

INDIA
Species Diversity of Algal Flora in Vishwamitri River, Baroda (India),
W86-01325 5A

Rockburst Drama in Northern India,
W86-01462 8A

Impact of Alkaline Particulates on pH of Rain Water in India,
W86-01606 5B

Effects of Temperature, Rainfall and Soil Moisture on Soil Respiration and Litter Decomposition in a Sub-Tropical Humid Forest Ecosystem,
W86-01759 2G

Brahmaputra River, Assam, India: Physiography, Basin Denudation, and Channel Aggradation,
W86-01768 2J

Incidence of Droughts and its Impact on Food Production in Rajasthan,
W86-01856 2B

INDIUM
Determination of Indium in Minerals, River Sediments and Coal Fly Ash by Electrothermal Atomic Absorption Spectrometry with Palladium as a Matrix Modifier,
W86-01718 7B

INDUCTIVELY COUPLED PLASMA ATOMIC EMISSION SPECTROMETRY
Zirconium Coprecipitation for Simultaneous Multielement Determination of Trace Metals in Seawater by Inductively Coupled Plasma Atomic Emission Spectrometry,
W86-01720 5A

INDUSTRIAL WASTEWATER
Industrial Effluent, How to Minimise the
ure,
W86-01634

INFILTRATION
Design of a Sensitive and Practical Closed
Infiltrometer,
W86-01423

Influence of Cylindrical Macropores on St
State Infiltration in a Soil Under Pasture,
W86-01660

Prediction of Steady-State Ponded Infilt
Distributions in a Soil With Vertical M
pores,
W86-01661

Redistribution of Bromide by Rainfall In
tion into a Cecil Sandy Loam Landscape,
W86-01716

Stability Analysis of Water Movement in
saturated Porous Materials; 3. Experim
Studies,
W86-01769

Kinematic Wave Approximation to Infilt
into Soils with Sorbing Macropores,
W86-01771

INFILTROMETERS
Design of a Sensitive and Practical Closed
Infiltrometer,
W86-01423

INFLOW SEEPAGE
Inflow Seepage Influence on Straight Al
Channels,
W86-01731

INFRARED IMAGERY
Thermal Infrared Detection of Subu
Springs Associated with the Plymouth
stone,
W86-01443

Estimating Universal Soil Loss Equation P
Values with Aerial Photography,
W86-01493

INJECTION WELLS
Uses and Abuses of Wastewater Injection
in Hawaii,
W86-01884

INORGANIC COMPOUNDS
Rate Constants of Reactions of Ozone wit
ganic and Inorganic Compounds in Water
Inorganic Compounds and Radicals,

IRRIGATION WATER
Saline Groundwater Management and Optimal Cropping Pattern,
W86-01380 4B

Volumetric Pricing of Agricultural Water Supplies: A Case Study,
W86-01766 6C

ISOTOPE STUDIES
Appropriate Monitoring Techniques Using Bomb Tritium and Other Geochemical Parameters in Hydrogeological Investigations,
W86-01445 2F

Distribution and Flux of 226Ra and 228Ra in the Amazon River Estuary,
W86-01535 2L

ISRAEL
Simplified Procedure for the Evaluation of the Lake Kinneret Evaporation,
W86-01475 2D

Evaluating Alternative Investment Programs for the Mediterranean-Dead Sea Project,
W86-01761 6B

ITALY
Construction of the Ridracoli Dam,
W86-01692 8A

Multivariate Analysis and Interpretation of the Hydrochemistry of a Dolomitic Reef Aquifer, Northern Italy,
W86-01773 2F

JAMES RIVER
Setting of the American Oyster Crassostrea virginica in the James River, Virginia, USA: Temporal and Spatial Distribution,
W86-01504 2L

JAPAN
Partitioning of Heavy Metals (Fe, Mn, Cd, Pb, Cu, Zn, Co, Ni and As) and P into Selective Chemical Fractions in Sediments from Lake Kojima (in Japanese),
W86-01362 5B

Distribution and Characteristics of Carboxypeptidase Activity in Pond, River, and Seawaters, in the Vicinity of Tokyo,
W86-01418 2H

Macroscopic Estimation of Available Water Resources in Kagoshima Prefecture, Japan (in Japanese),
W86-01604 2A

Hypergame Analysis of the Lake Biwa Conflict,
W86-01762 6B

JEFFERSON COUNTY
Aquatic Vegetation of a Natural Marl Lake in West Virginia,
W86-01594 2H

JETS
Prediction of Characteristics for Vertical Round Buoyant Jets in Stably Linear Stratified Environment,
W86-01392 8B

Plane Turbulent Buoyant Surface Jets and Jumps,
W86-01393 8B

Experimental Measurements of Multiple-Jet Induced Flow,
W86-01530 8B

KAGOSHIMA
Macroscopic Estimation of Available Water Resources in Kagoshima Prefecture, Japan (in Japanese),
W86-01604 2A

KAMES BAY
Effect of Temperature on the Growth of Planktonic Larvae of Tellina tenuis da Costa,
W86-01603 5C

KANAWHA RIVER
Survey of the Freshwater Mussel Fauna of the Kanawha River September 1981-September 1982,
W86-01592 2H

Corbicula fluminea (Mollusca: Pelecypoda) as a Biological Indicator of Heavy Metals in the Kanawha River, WV,
W86-01596 7A

KENTUCKY
Leaching Study of Oil Shale in Kentucky with a Section on Hydrologic Reconnaissance of the Oil Shale Outcrop in Kentucky,
W86-01918 5B

KENYA
Preliminary Investigation on Chemical Quality of Inland Waters in Kenya,
W86-01361 2K

Ethiopian Interests in the Division of the Nile River Waters,
W86-01379 6D

KESAGAMI LAKE
Shore Zone Mapping and Classification of a Northern Lake,
W86-01839 2H

KIELDER DAM
Numerical Analysis of Kielder Dam Spillway,
W86-01523 8B

KINEMATIC WAVE THEORY
Kinematic Wave Approximation to Infiltration into Soils with Sorbing Macropores,
W86-01771 2G

KINETICS
Copper Dissociation from Estuarine Humic Materials,
W86-01395 5B

KLAMATH BASIN
Organochlorine Chemical Residues in White Pelicans and Western Grebes from the Klamath Basin, California,
W86-01409 5C

KOREA
Year of the African Drought,
W86-01429 2B

KRAFT MILLS
Color Removal Process for Kraft Pulp and Paper Mill Effluents,
W86-01355 5D

LABRADOR
Sampling of Snow and Ice on Lakes,
W86-01788 2C

LAGOONS
Benthic Nutrient Remineralization in a Coastal Lagoon Ecosystem,
W86-01336 2L

Eutrophication and Management Initiatives for the Control of Nutrient Inputs to Rhode Island Coastal Lagoons,
W86-01337 5C

Tidal Exchange Between a Coastal Lagoon and Offshore Waters,
W86-01338 2L

Zooplankton Abundance Distribution, of a Mediterranean Lagoon Ecosystem: The Sarrazine Lagoon (Distributions d'Abondances du Zooplancton d'un Ecosysteme Lagunaire Mediterraneen: la Lagune de la Sarrazine),
W86-01511 2L

Organochlorine Hydrocarbon Residues in Sediments of Two Different Lagoons of Northwest Mexico,
W86-01899 5B

LAGRANGIAN TRANSPORT MODEL
Lagrangian Multi-Level Model of Transport, Transformation and Deposition of Atmospheric Sulfur Dioxide and Sulfate,
W86-01883 5B

LAILAD
Effects of Temperature, Rainfall and Soil Moisture on Soil Respiration and Litter Decomposition in a Sub-Tropical Humid Forest Ecosystem,
W86-01759 2G

LAKE BAIKAL
Investigations of the Ecology of Planktonic Algae of Water Bodies in the Baikal Region,
W86-01824 2H

Microbiological Characteristics of Water Masses in the Mouth Regions of Large Rivers Flowing into Northern Baikal,
W86-01825 2H

LAKE BEDS
Method for Locating Sediment Anomalies in Lakebeds That Can Be Caused by Groundwater Flow,
W86-01667 2H

LAKE BIWA
Hypergame Analysis of the Lake Biwa Conflict,
W86-01762 6B

LAKE CHAMPLAIN
Study of the Distribution of Freshwater Mussels (Mollusca: Pelecypoda: Unionoida) of the Lake Champlain Drainage in Northwestern New England,
W86-01877 2H

LAKE CONSTANCE
Seasonal Observations of Heterotrophic Activity and Active Bacterial Number in Lake Constance,
W86-01329 2H

LAKE ERIE
Estimating the Extent of Reduction Needed to Statistically Demonstrate Reduced Non-Point Phosphorus Loading to Lake Erie,
W86-01343 5G

Lake Erie Nutrient Loads, 1970-1980,
W86-01344 5G

LAKE EVAPORATION
Simplified Procedure for the Evaluation of the Lake Kinneret Evaporation,
W86-01475 2D

LAKE FROME
Estimation of Evaporation from the Normally 'Dry' Lake Frome in South Australia,
W86-01471 2D

LAKE GREVELINGEN
Lake Grevelingen: From an Estuary to a Saline Lake. An Introduction,
W86-01567 6G

Phytoplankton and Nutrient Dynamics in Saline Lake Grevelingen (SW Netherlands) under Different Hydrodynamical Conditions in 1978-1980,
W86-01568 6G

Nutrient Cycling and Ecosystem Behaviour in a Salt-Water Lake,
W86-01569 2H

Phytoplankton Primary Production in Brackish Lake Grevelingen (SW Netherlands) During 1976-1981,
W86-01570 2H

Changes of Sediment Distribution Patterns in Lake Grevelingen, an Enclosed Estuary in the SW Netherlands,
W86-01571 2H

Sediment-Water Exchange in Lake Grevelingen under Different Environmental Conditions,
W86-01572 2H

Nutrient Concentrations in the Interstitial Water of Lake Grevelingen Sediment: Effects of Sediment Redistribution and Benthic Primary Production Processes,
W86-01573 2H

Carbon Fixation and Chlorophyll in Bottom Sediments of Brackish Lake Grevelingen, The Netherlands,
W86-01574 2H

Dynamics, Migration and Growth of Nassarius reticulatus (Mollusca: Prosobranchia) Colonizing Saline Lake Grevelingen (SW Netherlands),
W86-01575 2H

Long-Term Evolution of the Meiofauna at a Sandy Station in Lake Grevelingen, The Netherlands,
W86-01576 2H

Density, Growth and Annual Food Consumption of Plaice (Pleuronectes platessa L.) and Flounder (Platichthys felsus (L.)) in Lake Grevelingen, The Netherlands,
W86-01577 2H

Carbon Mineralization in the Water c
Grevelingen (The Netherlands), as M
with the Oxygen Consumption Method,
W86-01578

Mineralization of Organic Carbon on an
Sediment of Lake Grevelingen,
W86-01579

Carbon Balance of a Saline Lake (Lake
lingen, The Netherlands),
W86-01580

LAKE HURON
Factors Affecting Growth and Recruit
Yellow perch, Perca flavescens Mitc
South Bay, Lake Huron,
W86-01508

LAKE ICE
Sampling of Snow and Ice on Lakes,
W86-01788

LAKE JACARETINGA
Responses of Phytoplankton in Lake Jac
to Enrichment with Nitrogen and Phosp
Concentrations Similar to Those of th
Solimoes (Amazon, Brazil),
W86-01500

LAKE KINNERET
Simplified Procedure for the Evaluatio
Lake Kinneret Evaporation,
W86-01475

LAKE KOJIMA
Partitioning of Heavy Metals (Fe, Mn,
Cu, Zn, Co, Ni and As) and P into
Chemical Fractions in Sediments fro
Kojima (in Japanese),
W86-01362

LAKE LOUISE
Aquatic Vegetation of a Natural Marl
West Virginia,
W86-01594

LAKE MAHKEENAC
Six Ponds Dioxin Survey,
W86-01551

LAKE MANITOBA
Sediment Resuspension and Currents
Manitoba,
W86-01341

LAKE MICHIGAN
Currents and Temperatures in Green B
Michigan,
W86-01342

Contaminant Levels in Colonial W
from Green Bay and Lake Michigan,
W86-01885

LAKE ONTARIO
Discrimination of the Stock of Fish (
guilla rostrata) Based on the Presen
Synthetic Chemical Mirex (Discrimin
Stock de Poisson, l'Anguille (Anguilla
Basee sur la Presence d'un Produit Ch
Synthese, le Mirex),
W86-01584

Identification of New, Fluorinated Bi
the Niagara River-Lake Ontario Area,
W86-01621

LAKE PATZCUARO
Benthic Organisms as Indicators of W
ity in Lake Patzcuaro, Mexico,
W86-01608

KE PONTCHARTRAIN
Factors Influencing the Salinity Regime of Lake Pontchartrain, Lousisana, a Shallow Coastal Lagoon: Analysis of a Long-Term Data Set, W86-01335 6G

KE SEDIMENTS
Partitioning of Heavy Metals (Fe, Mn, Cd, Pb, Cu, Zn, Co, Ni and As) and P into Selective Chemical Fractions in Sediments from Lake Kojima (in Japanese), W86-01362 5B

Assessment of Pollution History from Recent Sediments in Lake Vanajavesi, Southern Finland. I. Selection of Representative Profiles, Their Dating and Chemostratigraphy, W86-01365 5B

Changes in Sediment Composition During Seasonal Resuspension in Small Shallow Dimictic Inland Lakes, W86-01398 2J

Changes of Sediment Distribution Patterns in Lake Grevelingen, an Enclosed Estuary in the SW Netherlands, W86-01571 2H

Sediment-Water Exchange in Lake Grevelingen under Different Environmental Conditions, W86-01572 2H

Carbon Fixation and Chlorophyll in Bottom Sediments of Brackish Lake Grevelingen, The Netherlands, W86-01574 2H

Mineralization of Organic Carbon on and in the Sediment of Lake Grevelingen, W86-01579 2H

Role of Mn(2+)-Rich Hydrous Manganese Oxide in the Accumulation of Arsenic in Lake Sediments, W86-01645 5B

Sediment Concentration Effects in Liquid/Solid Partitioning, W86-01869 5B

Contaminant Residues in Fish and Sediments from Lakes in the Atchafalaya River Basin (Louisiana), W86-01890 5B

E SHORES
Zone Mapping and Classification of a Northern Lake, W86-01839 2H

E SUPERIOR
Chlorinated Hydrocarbon Cycling in the Anoxic Nepheloid Layer of Lake Superior, W86-01875 5B

VANAGAVESI
Assessment of Pollution History from Recent Sediments in Lake Vanajavesi, Southern Finland. II. Changes in the Chironomidae, Chaoboridae and Ceratopogonidae (Diptera) Fauna, W86-01366 5B

VANAJAVESI
Assessment of Pollution History from Recent Sediments in Lake Vanajavesi, Southern Finland. I. Selection of Representative Profiles, Their Dating and Chemostratigraphy, W86-01365 5B

WINTHROP
Ponds Dioxin Survey, W86-01551 5C

LAKES
Approach to the Restoration of Aquatic Vegetation in the Xihu Lake of Hangzhou, with Reference to the Water Quality Problem (in Chinese), W86-01324 5G

Mixed Layer Dynamics in a Lake Exposed to a Spatially Variable Wind Field, W86-01412 2H

River Recession Analysis in the Operational Management of Lake Abstraction, W86-01522 2E

Nutrient Cycling and Ecosystem Behaviour in a Salt-Water Lake, W86-01569 2H

Water Circulation in Small Arctic Lakes in Winter, W86-01586 2H

Winter Respiration of Lakes at Saqvaqjuac, N.W.T., W86-01587 2H

Simple Method to Estimate Lake Phosphorus Concentrations Resulting from Natural, Background, Loadings, W86-01640 2H

Shore Zone Mapping and Classification of a Northern Lake, W86-01839 2H

Nutrient Demand and Availability among Planktonic Communities - An Attempt to Assess Nutrient Limitation to Plant Growth in 12 Central Volcanic Plateau Lakes, W86-01911 2H

Investigation of Sampling Strategies for Lake Benthos, W86-01913 2H

LAMPRICIDES
Effects of Contaminants on Toxicity of the Lampricides TFM and Bayer 73 to Three Species of Fish, W86-01349 5C

LAND DEVELOPMENT
Impact of River Channelization; II. Channelization: Some Engineering Aspects, W86-01402 4A

LAND DISPOSAL
Treatment of Wastewater by Application to Forest Land, W86-01464 5D

Impact of Land-Applied Incinerator Ash Residue on a Freshwater Wetland Plant Community, W86-01466 5C

LAND RECLAMATION
Effect of Sewage Sludge on Microbial Activity in an Old, Abandoned Minesoil, W86-01702 5E

Reclaiming Desert Lands Through Water Reuse, W86-01746 5D

LAND USE
Long-Term Streamflow Observations in Relation to Basin Development, W86-01472 4C

LANDFILL LINERS
Design Considerations for a Novel Landfill Liner, W86-01730 5G

LANDFILLS
Application of Artificial Clays in the Control of Toxic Pollutants, W86-01456 5E

Measuring the Waterbalance of a Three-Layer Cover of a Domestic Waste Landfill, W86-01459 5G

Use of a Cement-Bentonite Cut-Off Wall to Contain Possible Pollutants from a Landfill Containing Highly Polluted Dredging Spoils, W86-01460 5G

Hazardous Waste Cleanup: The Preliminaries, W86-01738 5G

LANZHOU
Wastewater Treating at Lanzhou, W86-01442 5D

LARCH TREES
Light Reduction and Moisture Stress: Effects on Growth and Water Relations of Western Larch Seedlings, W86-01785 2I

LARGE SCALE STUDIES
International Perspective on Large-Scale Snow Studies, W86-01446 2C

LARIX
Canopy Transpiration and Water Fluxes in the Xylem of the Trunk of Larix and Picea Trees - a Comparison of Xylem Flow, Porometer and Cuvette Measurements, W86-01601 2I

LARVAE
Combined Effects of Salinity and Cadmium Chloride upon Embryos and Larvae of the Japanese Oyster, Crassostrea gigas, W86-01790 5C

LEACHING
Effect of Leaching on the Integrity of a Natural Clay, W86-01457 5E

Model for Nitrate Leaching in Undisturbed Structured Clay Soil During Unsteady Flow, W86-01655 5B

Leaching Fraction Beyond Depth x, Caused by Percolation of a Soil Profile with an Initial Salt Accmulation at its Surface, W86-01662 2G

Effect of the Content of Organic Matter in Soil on Leaching of Chemical Fertilizers into the Zone of Aeration and Groundwaters, W86-01822 5B

Leaching Study of Oil Shale in Kentucky with a Section on Hydrologic Reconnaissance of the Oil Shale Outcrop in Kentucky, W86-01918 5B

LEAD
Diagenetic Remobilization of Manganese, Iron, Copper and Lead in Anoxic Sediment of a Freshwater Pond, W86-01646 2H

Biogeochemistry of Lead in McDonalds Branch Watershed, New Jersey Pine Barrens, W86-01703 5B

Lead Distribution and Fluxes in a High-Elevation Forest in Northern Vermont, W86-01706 5B

Occurrence and Dissipation of High Lead Level Episodes in the Lower Mississippi River, W86-01735 5B

Determination of Zinc, Cadmium, Lead and Copper in Precipitation by Computerized Differential Pulse Voltammetry, W86-01846 5A

LEAD COMPOUNDS
Methylation of Tin and Lead in the Environment: Oxidative Methyl Transfer as a Model for Environmental Reactions,
W86-01619 5B

LEAD RADIOISOTOPES
Sediment Accumulation Rates in Irondequoit Bay, New York Based on Lead-210 and Cesium-137 Geochronology,
W86-01566 2L

LEAKAGE
Formation of Useful Groundwater Resources in the Southwestern Part of the Moscow Artesian Basin Under Intense Withdrawal Conditions,
W86-01803 2F

LEAVES
Microbial Degradation of the Leachable and Lignocellulosic Components of Leaves and Wood from Rhizophora mangle in a Tropical Mangrove Swamp,
W86-01503 2L

LEECHES
Inter- and Intra-Habitat Distribution of Leeches in a Eutrophic English Lake,
W86-01499 2H

LEGAL ASPECTS
Law of the Coast in a Clamshell; Part XIV: The Maryland Approach,
W86-01829 6E

Law of the Coast in a Clamshell; Part X: The North Carolina Approach,
W86-01833 2L

Law of the Coast in a Clamshell; Part XV: The South Carolina Approach,

LIGHT ATTENUATION
Attenuation Versus Transparency,
W86-01725 5A

LIGNOCELLULOSE
Effects of pH and Plant Source on Lignocellulose Biodegradation Rates in Two Wetland Ecosystems, the Okefenokee Swamp and a Georgia Salt Marsh,
W86-01413 2L

Microbial Degradation of the Leachable and Lignocellulosic Components of Leaves and Wood from Rhizophora mangle in a Tropical Mangrove Swamp,
W86-01503 2L

LIMITING NUTRIENTS
Phosphorus Limitation of Lotic Periphyton Growth Rates: An Intersite Comparison Using Continuous-Flow Troughs (Thomas River System, British Columbia),
W86-01416 2H

Factors Controlling Phosphorus Limitation in Stream Sediments,
W86-01417 2H

Molybdenum Availability, Nitrogen Limitation, and Phytoplankton Growth in Natural Waters,
W86-01863 2H

Nutrient Demand and Availability among Planktonic Communities - An Attempt to Assess Nutrient Limitation to Plant Growth in 12 Central Volcanic Plateau Lakes,
W86-01911 2H

LIMNOCRENES
Population and Reproductive Dynamics of Nais communis (Oligochaeta: Naididae) from a Wisconsin Limnocrene,
W86-01879 2H

LINEAR PROGRAMMING
Chance-Constrained/Stochastic Linear Programming Model for Acid Rain Abatement - I. Complete Colinearity and Noncolinearity,
W86-01381 5B

LINERS
Physical and Chemical Behaviour of Clay-Based Barriers under Percolation with Test Liquids,
W86-01458 5G

Hydraulic Conductivity of Two Prototype Clay Liners,
W86-01531 5G

LIQUEFACTION
Liquefaction of Fine Sand Due to Wave Action,
W86-01845 8D

LITTER
Effects of Temperature, Rainfall and Soil Moisture on Soil Respiration and Litter Decomposition in a Sub-Tropical Humid Forest Ecosystem,
W86-01759 2G

LOCH ARD FOREST
Uptake and Release of Some Trace Metals by Aquatic Bryophytes in Acidified Waters in Scotland,
W86-01452 7B

LOGGING
Limits on the Usefulness of Erosion-Hazard Ratings: Experiences in Northwestern California,
W86-01783 4D

Effects on the Forest Floor of Whole-Tree Harvesting in an Appalachian Oak Forest,
W86-01878 2H

LOIRE ESTUARY
Water Quality in an Estuarine Environment: Annual Cycle of the Physical and Chemical Parameters of the Water of the Loire Estuary (Qualite des eaux en milieu estuarien: Suivi annuel de criteres physiques et chimiques dans les eaux de l'estuaire de la Loire),
W86-01505 2L

LONG ISLAND
Nitrogenous Nutrient Uptake, Primary Production, and Species Composition of Phytoplankton in the Carmans River Estuary, Long Island, New York,
W86-01415 2L

Measurement of Groundwater Recharge on Eastern Long Island, New York, U.S.A.,
W86-01665 2F

LONG ISLAND SOUND
Origin of High Cadmium Concentrations in Hudson River Blue Crab (Callinectes sapidus Rathbun),
W86-01565 5C

Metals and PCB Concentrations in Mussels from Long Island Sound,
W86-01900 5C

LOS ANGELES
Chemical Characterization of Stratus Cloudwater and its Role as a Vector for Pollutant Deposition in a Los Angeles Pine Forest,
W86-01652 5B

Seawater Reverse Osmosis - an Economic Alternative to Distillation,
W86-01674 3A

MULTISTAGE ORIFICES
Preventing Cavitation with Multistage Orifices,
W86-01721 8C

MULTIVARIATE ANALYSIS
Multivariate Analysis and Interpretation of the Hydrochemistry of a Dolomitic Reef Aquifer, Northern Italy,
W86-01773 2F

MUSSELS
Organochlorines and Trace Metals in Green-Lipped Mussels Perna viridis from Hong Kong Waters: A Test of Indicator Ability,
W86-01514 5A

Survey of the Freshwater Mussel Fauna of the Kanawha River September 1981-September 1982,
W86-01592 2H

Influence of Cyclic Exposure on the Accumulation of Heavy Metals by Mytilus edulis planulatus (Lamarck),
W86-01796 5C

Detoxification of Copper in the Cells of the Digestive Gland of Mussel: The Role of Lysosomes and Thioneins,
W86-01866 5C

Study of the Distribution of Freshwater Mussels (Mollusca: Pelecypoda: Unionoida) of the Lake Champlain Drainage in Northwestern New England,
W86-01877 2H

Metals and PCB Concentrations in Mussels from Long Island Sound,
W86-01900 5C

MUTAGENICITY
Toxicity and Mutagenicity Evaluation of Water Coagulated with Moringa oleifera Seed Preparations Using Fish, Protozoan, Bacterial, Coliphage, Enzyme and Ames Salmonella Assays,
W86-01858 5F

NAPHTHALENE
Degradation and Mineralization of the Polycyclic Aromatic Hydrocarbons Anthracene and Naphthalene in Intertidal Marine Sediments,
W86-01481 5B

NAPHTHALENES
Effect of Hydrocarbon Mixtures on Adsorption of Substituted Naphthalenes by Clay and Sediment from Water,
W86-01852 5B

NAPTHOL
Dissipation of Carbaryl and the 1-Naphthol Metabolite in Flooded Rice Fields,
W86-01708 5B

NATURAL WATERS
Tritium in Natural Waters of Moldavia and a Hydrogeological Interpretation of the Results of its Determination,
W86-01806 2H

Phosphorus Forms and Content in Natural Water and Factors Determining its Cycling,
W86-01811 2K

NEEDLES
Needle Water Potential and Soil-to-Foliage Flow Resistance During Soil Drying: A Comparison of Douglas-fir, Western Hemlock, and Mountain Hemlock,
W86-01787 2I

NEGOTIATIONS
Trading 404 Permits for Enhanced Fish Habitat,
W86-01681 6G

NEMATODES
Long-Term Evolution of the Meiofauna at a Sandy Station in Lake Grevelingen, The Netherlands,
W86-01576 2H

NETHERLANDS
Drainage Coefficients for Heavy Land,
W86-01431 2G

Lake Grevelingen: From an Estuary to a Saline Lake. An Introduction,

Short-Term Endproducts of Sulfate Reduction in a Salt Marsh: Formation of Acid Volatile Sulfides, Elemental Sulfur, and Pyrite,
W86-01614 2L

SULFATES
Atmospheric Sulfur Dioxide and Rainwater at a Coastal Locality in N.W. England,
W86-01352 5B

SULFIDES
Sulfide Control of Cadmium and Copper Concentrations in Anaerobic Estuarine Sediments,
W86-01800 5B

SULFITES
Behavioral Modification of Estuarine Fish Exposed to Sulfur Dioxide,
W86-01679 5C

SULFUR DIOXIDE
Behavioral Modification of Estuarine Fish Exposed to Sulfur Dioxide,
W86-01679 5C

Growth Response of Yellow-Poplar (Liriodendron tulipifera L.) Seedlings to Ozone, Sulfur Dioxide, and Simulated Acidic Precipitation, Alone and in Combination,
W86-01876 5C

Lagrangian Multi-Level Model of Transport, Transformation and Deposition of Atmospheric Sulfur Dioxide and Sulfate,
W86-01883 5B

SUNFISH
Lysosomal Enzyme Release in the Bluegill Sunfish (Lepomis macrochirus Rafinesque) Exposed to Cadmium,
W86-01894 5C

SURFACE DRAINAGE
Drainage Coefficients for Heavy Land,
W86-01431 2G

SURFACE WATER
Leaching Study of Oil Shale in Kentucky with a Section on Hydrologic Reconnaissance of the Oil Shale Outcrop in Kentucky,
W86-01918 5B

SURFACTANTS
Determination of Nonionic Surfactants in Water by Atomic Absorption Spectrometry,
W86-01848 5A

SURVEYS
Obtaining Public Support for Reuse Water,
W86-01744 3B

SUSPENDED SEDIMENT
Characteristics of Suspended Sediment Transport in the Lower Hudson River,
W86-01559 2J

SUSPENDED SEDIMENTS
Sediment Resuspension and Currents in Lake Manitoba,
W86-01341 2H

Effects of Dredging Operations on Nutrient and Suspended Sediment Concentrations,
W86-01563 5B

Estimating Algal Available Phosphorus in Suspended Sediments by Chemical Extraction,
W86-01714 5A

SUSPENDED SOLIDS
Effect of Suspended Solids on the Growth of Apical Tips of Gametophyte Plants of Lemanea and on Carpospore Germination and Subsequent Colonisation,
W86-01498 5C

Generalized Continuum Theory for Multiphase Suspension Flows,
W86-01533 2J

Dissolved Coloured Compounds and Suspended Matter in the Waters of the Middle Waikato River,
W86-01912 5B

SWELLING PRESSURE
Water Flow and Swelling Pressure in Non-Saturated Bentonite-Based Clay Barriers,
W86-01455 2F

SYNERGETIC GEOMETRY
New Flow Models Can Help Solve Pump-Cavitation Problems,
W86-01680 8B

TANAJIB
Seawater Desalination by Reverse Osmosis Plant Design, Performance Data, Operation and Maintenance (Tanajib, Arabian Gulf Coast),
W86-01675 3A

TANZANIA
Drainage Coefficients for Heavy Land,
W86-01431 2G

TAXONOMY
Identifying Pollution Related Changes in Chironomid Communities as a Function of Taxonomic Rank,
W86-01583 5C

TELEMETRY
Replacement of the Telemetry System of the Sunderland and South Shields Water Company,
W86-01521 7B

Radio-Telemetry as an Aid to Environmental Contaminant Evaluation of Mobile Wildlife Species,
W86-01886 7B

TELLINA
Effect of Temperature on the Growth of Planktonic Larvae of Tellina tenuis da Costa,
W86-01603 5C

TEMEPHOS
Temephos Residues in Stagnant Ponds After Mosquito Larvicide Applications by Helicopter,
W86-01897 5B

TEMPERATURE
Evaluation of Mathematical Models for the Effects of pH and Temperature on Ammonia Toxicity to Aquatic Organisms,
W86-01648 5C

TEMPORAL DISTRIBUTION
Setting of the American Oyster Crassostrea virginica in the James River, Virginia, USA: Temporal and Spatial Distribution,
W86-01504 2L

Heterotrophic Bacteria in Water Distribution Systems. I. Spatial and Temporal Variation,
W86-01914 5F

TENNESSEE
Water Quality Effects of Clearcutting Upper Coastal Plain Loblolly Pine Plantations,
W86-01705 6G

TETRACHLORODIBENZO-P-DIOXIN
Survey of 2,3,7,8-Tetrachlorobidenzo-p-dioxin in Fish from the Great Lakes and Selected Michigan Rivers,
W86-01527 5B

TEXAS
Long-Term Estuarine Variability and Association Biological Response,
W86-01334 2L

Effects of Autumn Application of Oil on Spartina alterniflora in a Texas Salt Marsh,
W86-01465 5C

Effects of a Crude Oil Spill on Water Quality and Macrobenthos of a Southeast Texas Stream,
W86-01506 5C

Some Considerations in Modeling the Fate and Transport of Toxicants in Surface Water Systems,
W86-01552 5B

Can We Save the Ogallala,
W86-01737 4B

Volumetric Pricing of Agricultural Water Supplies: A Case Study,
W86-01766 6C

Insecticide Resistance in Mosquitofish of the Lower Rio Grande Valley of Texas - An Ecological Hazard,
W86-01889 5C

TFM
Effects of Contaminants on Toxicity of the Lampricides TFM and Bayer 73 to Three Species of Fish,
W86-01349 5C

THAILAND
Lower Mae Ping Project, Thailand,
W86-01374 6B

Trace Metals in Bivalve Molluscs from Thailand,
W86-01791 5C

THAMES RIVER
Mobile Oxygenation in the Thames Estuary,
W86-01439 5G

THERMAL INERTIA
Discrimination of Soil Physical Parameters, Thermal Inertia, and Soil Moisture from Diurnal Surface Temperature Fluctuations,
W86-01772 2G

THIOBENCARB
Comparative Acute Sensitivities of Early Life Stages of Atherinid Fishes to Chlorpyrifos and Thiobencarb,
W86-01408 5C

THOMAS RIVER SYSTEM
Phosphorus Limitation of Lotic Periphyton Growth Rates: An Intersite Comparison Using Continuous-Flow Troughs (Thomas River System, British Columbia),
W86-01416 2H

TIDAL BASINS
Investigation of a Eutrophic Tidal Basin: Part 2 - Nutrients and Environmental Aspects,
W86-01789 5C

TIDAL WATERS
Tidal Exchange Between a Coastal Lagoon and Offshore Waters,
W86-01338 2L

TIJUANA
Seeking Treatment; Sewage Solutions in San Diego,
W86-01540 5D

TIME SERIES ANALYSIS
Investigation of Relationships Among Pollutant Loadings and Fish Stock Levels in Northeastern Estuaries,
W86-01332 5C

Probability Distribution Members of a Ranked Sample,
W86-01817 6A

TIN COMPOUNDS
Methylation of Tin and Lead in the Environment: Oxidative Methyl Transfer as a Model for Environmental Reactions,
W86-01619 5B

TOKYO BAY
Distribution and Characteristics of Carboxypeptidase Activity in Pond, River, and Seawaters, in the Vicinity of Tokyo,
W86-01418 2H

TOLUENE
Effect of Toluene on Fathead Minnow (Pimephales promelas Rafinesque) Development,
W86-01892 5C

TOPOGRAPHY
Prediction of 2-D Bed Topography in Rivers,
W86-01734 2J

TORTS
Waters and Water Courses - Torts - Owners of Property Damaged by Unlawful Ditching or Unreasonable Discharge of Waters May Obtain Relief by Statute or by the Tort Concept of Reasonable Use,
W86-01683 6E

TOXICITY
Effects of Environmental and Biological Variables on the Toxicity of Mercuric Chloride,
W86-01353 5C

Investigations on Paraquat Toxicity in Fishes,
W86-01378 5C

Acute and Sublethal Effects of Organotin Compounds on Aquatic Biota: An Interpretative Literature Evaluation,
W86-01400 5C

Morphometric Analysis of the Response of Anabaena flos-aquae and Anabaena variabilis (Cyanophyceae) to Selected Concentrations of Zinc,
W86-01405 5C

Microbial Assay for Determining the Influence of Physicochemical Environmental Factors on the Toxicity of Organics: Phenol,
W86-01407 5C

Comparative Acute Sensitivities of Early Life Stages of Atherinid Fishes to Chlorpyrifos and Thiobencarb,
W86-01408 5C

Effect of Lethal Copper Solutions on the Behavior of Rainbow Trout, Salmo gairdneri,
W86-01410 5C

Low pH Tolerance Under Continuous-Flow Bioassay Conditions of Hellgrammite Larvae, Corydalus cornutus L. (Megaloptera: Corydalidae),
W86-01597 5C

Evaluation of Mathematical Models for the Effects of pH and Temperature on Ammonia Toxicity to Aquatic Organisms,
W86-01648 5C

Tolerance of Bathyporeia pilosa Lindstrom (Amphipoda: Haustoriidae) to Organic and Inorganic Salts of Mercury,
W86-01794 5C

Study of the Toxicity of Some Silicone Compounds in Relation to Marine Biological Chains,
W86-01853 5C

Toxicity and Mutagenicity Evaluation of Water Coagulated with Moringa oleifera Seed Preparations Using Fish, Protozoan, Bacterial, Coliphage, Enzyme and Ames Salmonella Assays,
W86-01858 5F

Predicting the Effect of Toxic Substances on Pelagic Ecosystems,
W86-01865 5C

Detoxification of Copper in the Cells of the Digestive Gland of Mussel: The Role of Lysosomes and Thioneins,
W86-01866 5C

Effect of Toluene on Fathead Minnow (Pimephales promelas Rafinesque) Development,
W86-01892 5C

Acute Toxicity of Four Phenoxy Herbicides to Aquatic Organisms,
W86-01898 5C

Daphnia magna as an Indicator of the Acute Toxicity of Waste Waters,
W86-01905 5A

TRACE METALS
Uptake and Release of Some Trace Meta
Aquatic Bryophytes in Acidified Waters in
land,
W86-01452

Organochlorines and Trace Metals in G
Lipped Mussels Perna viridis from Hong
Waters: A Test of Indicator Ability,
W86-01514

Biogeochemistry of Aluminum in McDo
Branch Watershed, New Jersey Pine Ba
W86-01704

Determination of Indium in Minerals,
Sediments and Coal Fly Ash by Electroth
Atomic Absorption Spectrometry with Pa
um as a Matrix Modifier,
W86-01718

Zirconium Coprecipitation for Simulta
Multielement Determination of Trace Met
Seawater by Inductively Coupled P
Atomic Emission Spectrometry,
W86-01720

Trace Metals in Bivalve Molluscs from
land,
W86-01791

Trace Metals and Hydrocarbons in Sedi
from the Southampton Water Region, wit
ticular Reference to the Influence of Oil
ery Effluent,
W86-01797

TRACERS
Analysis of Some Laboratory Tracer R
Natural Fissures,
W86-01767

Effect of Seawater Magnesium on Natural
rescence During Estuarine Mixing, and In
tions for Tracer Applications,
W86-01801

TRAINING
Training: The Bridge Between Treatme
Technology,
W86-01489

TRANSKEI
Chemical Composition of Transkei River
W86-01862

TRANSPARENCY
Attenuation Versus Transparency,
W86-01725

TRANSPIRATION
Canopy Transpiration and Water Fluxes
Xylem of the Trunk of Larix and Picea T
Comparison of Xylem Flow, Porometer a
vette Measurements,
W86-01601

TRANSPORT
Partitioning and Transport of Metals Acr
O2/H2S Interface in a Permanently
Basin: Framvaren Fjord, Norway,
W86-01396

TRAPEZOIDAL CHANNELS
Trapezoidal Channels with Increasing
charge,
W86-01541

TREES
Canopy Transpiration and Water Fluxes
Xylem of the Trunk of Larix and Picea T
Comparison of Xylem Flow, Porometer a
vette Measurements,
W86-01601

RIAXIAL SYSTEMS
Low Gradient Permeability Measurements in a Triaxial System,
W86-01450 2G

ICHLOROPHENOL
Reductive Dechlorination of the Pesticides 2,4-D, 2,4,5-T, and Pentachlorophenol in Anaerobic Sludges,
W86-01707 5D

ICHLOROPHENOXY ACETIC ACID
Reductive Dechlorination of the Pesticides 2,4-D, 2,4,5-T, and Pentachlorophenol in Anaerobic Sludges,
W86-01707 5D

IHALOMETHANES
Role of Formation and Reduction of THM and Chlorite Concentrations in the Disinfection of Water with Cl2 and ClO2,
W86-01453 5F

ITIUM
ppropriate Monitoring Techniques Using omb Tritium and Other Geochemical Parameters in Hydrogeological Investigations,
W86-01445 2F

ritium in Natural Waters of Moldavia and a ydrogeological Interpretation of the Results of Determination,
W86-01806 2H

OPICAL REGIONS
anagement of Lacustrine Fisheries in the ropics,
86-01600 8I

OUT
ffect of Lethal Copper Solutions on the Behav- of Rainbow Trout, Salmo gairdneri,
86-01410 5C

oconcentration Factors of Some Halogenated ganics for Rainbow Trout: Limitations in eir Use for Prediction of Environmental Resi-es,
86-01874 5C

asonal Changes in Abundance of Brown out (Salmo trutta) and Rainbow Trout (S. rdnerii) Assessed by Drift Diving in the Ran-kei River, New Zealand,
86-01910 2H

SA
nicipal Water Demand Study, Oklahoma y and Tulsa, Oklahoma,
6-01765 6D

EN RIVER
nitoring and Evaluation of Water Pollution Tumen River by Means of Algae (in Chinese),
6-01512 5C

NEL CONSTRUCTION
vatering for the Well-Being of Tunnelling,
6-01463 8A

Hazardous Waste Cleanup: The Preliminaries,
W86-01738 5G

WATER POLLUTION EFFECTS
Reconstruction of Long-Term Time Series for Commercial Fisheries Abundance and Estuarine Pollution Loadings,
W86-01331 5C

Investigation of Relationships Among Pollutant Loadings and Fish Stock Levels in Northeastern Estuaries,
W86-01332 5C

Effects of Contaminants on Toxicity of the Lampricides TFM and Bayer 73 to Three Species of Fish,
W86-01349 5C

Effects of Effluent of Municipal Wastewater on the Growth of Porphyra yezoensis in the Case of Static Culture (in Japanese),
W86-01363 5C

Acute and Sublethal Effects of Organotin Compounds on Aquatic Biota: An Interpretative Literature Evaluation,
W86-01400 5C

Identification of Ferritin as a Major High Molecular Weight Zinc-Binding Protein in the Tropical Rock Oyster, Saccostrea cucullata,
W86-01406 5C

Solubilzation Effects of Simulated Acid Rain on the Organic Matter of Forest Soil; Preliminary Results,
W86-01421 5C

Effects of Autumn Application of Oil on Spartina alterniflora in a Texas Salt Marsh,
W86-01465 5C

Effects of a Crude Oil Spill on Water Quality and Macrobenthos of a Southeast Texas Stream,
W86-01506 5C

Monitoring and Evaluation of Water Pollution in Tumen River by Means of Algae (in Chinese),
W86-01512 5C

PCBs: Dietary Dose and Burdens in Striped Bass From the Hudson River,
W86-01555 5C

Identifying Pollution Related Changes in Chironomid Communities as a Function of Taxonomic Rank,
W86-01583 5C

Associations of Cancer Mortality Rates and Exogenous Environmental Factors in West Virginia,
W86-01593 5C

Aluminum Mobilization in an Acidic Headwater Stream: Temporal Variation and Mineral Dissolution Disequilibria,
W86-01678 5C

Behavioral Modification of Estuarine Fish Exposed to Sulfur Dioxide,
W86-01679 5C

Effect of Sewage Sludge on Microbial Activity in an Old, Abandoned Minesoil,
W86-01702 5E

Chlorinated Hydrocarbons and Hatching Success in Baltic Herring Spring Spawners,
W86-01799 5C

Fate and Toxicity of High Density Missile Fuels RJ-5 and JP-9 in Aquatic Test Systems,
W86-01854 5C

Growth Response of Yellow-Poplar (Liriodendron tulipifera L.) Seedlings to Ozone, Sulfur Dioxide, and Simulated Acidic Precipitation, Alone and in Combination,
W86-01876 5C

Temephos Residues in Stagnant Ponds After Mosquito Larvicide Applications by Helicopter,
W86-01897 5B

Acute Toxicity of Four Phenoxy Herbicides to Aquatic Organisms,
W86-01898 5C

Daphnia magna as an Indicator of the Acute Toxicity of Waste Waters,
W86-01905 5A

WATER POLLUTION SOURCES
Anthropogenic, Polyhalogenated, Organic Compounds in Sedentary Fish from Lake Huron and Lake Superior Tributaries and Embayments,
W86-01347 5B

WATER POLLUTION SOURCES

Background Levels of Dissolved/Dispersed Petroleum Residues in the Gulf of St. Lawrence, 1970-79,
W86-01588 5B

Identification of New, Fluorinated Biphenyls in the Niagara River-Lake Ontario Area,
W86-01621 5B

Water Quality of a Small Urban Catchment near Durban, South Africa,
W86-01861 5B

Leaching Study of Oil Shale in Kentucky with a Section on Hydrologic Reconnaissance of the Oil Shale Outcrop in Kentucky,
W86-01918 5B

WATER POTENTIAL

Estimation of Twig Xylem Water Potential in Young Douglas-fir Trees,
W86-01781 2I

Needle Water Potential and Soil-to-Foliage Flow Resistance During Soil Drying: A Comparison of Douglas-fir, Western Hemlock, and Mountain Hemlock,
W86-01787 2I

WATER QUALITY

Approach to the Restoration of Aquatic Vegetation in the Xihu Lake of Hangzhou, with Reference to the Water Quality Problem (in Chinese),
W86-01324 5G

Hydrology of Mid-Altitude Tussock Grasslands, Upper Waipori Catchment, Otago. I. Erosion, Sediment Yields and Water Quality,

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 19, NUMBER 6
JUNE 1986

-- W86-02419
SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Geological Survey, U.S. Department of the Interior, and published monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Water Resources Division, U.S. Geological Survey, MS 425, Reston, VA 22092. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $115, Journal and Annual Indexes, $145; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A monthly publication of the Geological Survey
U.S. Department of the Interior

VOLUME 19, NUMBER 6
JUNE 1986

W86-01920 -- W86-02419

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Office of Management and Budget through September 30, 1986.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a monthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Water Resources Scientific Information Center. The cumulative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE WATER RESOURCES SCIENTIFIC INFORMATION CENTER DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

1. NATURE OF WATER

1B. Aqueous Solutions and Suspensions

ONDUCTANCE: A COLLECTIVE MEASURE OF DISSOLVED IONS,
Geological Survey, Menlo Park, CA.
D. Hem.
N: Water Analysis, Academic Press, Orlando, FL. 982, Volume 1: Inorganic Species, Part 1. p 137-61, 7 fig, 28 ref.

escriptors: *Conductance, *Physical properties, Chemical properties, *Conductivity, *Specific nductivity, Dissolved solids, Natural waters, Sa-nity, Ions, Irrigation water, Trace elements, Phy-ochemical properties.

he physical basis for electrical conductance in ueous solutions, the influence of solute concen-ations and related factors on conductance, and e ways in which these influences are evaluated e examined. The specific conductance of a sub-nce is the conductance over 1 cm of a segment the material having a cross-sectional area of 1 sq . The equivalent conductance of a solute is the nductance of one gram of the material dissolved water. Major factors affecting limiting equiva-nt conductances include ionic size, charge and eed. Increased temperatures bring about in-eased ion movement. Conductivity cells usually ve platinum electrodes. Compensations that can made for temperature effects, and types of easuring instruments are described. Conductivity lues are related to salinity and have been used to aluate the usability of water for irrigation or er purposes or the need for correcting undesir-e salinity levels in soils. The conductivity of ural waters varies considerably depending upon solved solids content. Conductivity measure-nts may also be applied to the calculation of al ionic concentrations in equivalents per liter, estimation of ionic strength of solutions, and estimation of the gravimetric dissolved solute ncentration. 2. WATER CYCLE

A. General

TER RESOURCES AND EFFECTS OF DE-LOPMENT IN HERNANDO COUNTY, ORIDA,
ological Survey, Tampa, FL. Water Resources
. Fretwell.
ilable from OFSS, USGS, Box 25425 Lake-od, CO 80225. USGS Water-Resources Investi-ons Report 84-4320, 1985. 83 p, 33 fig, 7 tab, 61

criptors: *Groundwater, *Water supply, Water ity, *Saltwater intrusion, Karst Floridan aqui-system, Hernando County, *Florida.

pite of the hill and valley terrain in the Brooks-Ridge area of Hernando County, Florida, surface drainage occurs within the county. harge to the Floridan aquifer system occurs as tration of precipitation within the county or as nd-water flow from Sumter County to the east Pasco County to the south. Discharge is prin-lly to the Gulf of Mexico, but some ground r flows north into Citrus County before it hes the Gulf. The Floridan aquifer system is rally unconfined. Water quality is generally l except near the coast where high chloride rs. Water from the Floridan aquifer system unted for 87 percent of the water used for ation, industry, and rural and public supply in . Sixty-seven percent of this water was used ndustry. Rock mining, the major industry, used ercent of the industrial water. The anticipated ease in population in the county between 1982 2000 will increase demand for water primarily public water-supply systems. This higher demand will cause about a 1 percent reduction in flow from Weeki Wachee Springs, but little change in lake levels or saltwater intrusion will occur if the projected additional supplies are developed far enough inland from the coast. (USGS)
W86-01931

HABITAT SUITABILITY INDEX MODELS: REGRESSION MODELS BASED ON HARVEST OF COOLWATER AND COLDWATER FISHES IN RESERVOIRS,
Fish and Wildlife Service, Fayetteville, AR. National Reservoir Research Program.
L. R. Aggus, and W. M. Bivin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB83-147348, Price codes: A03 in paper copy, A01 in microfiche. Report FWS/OBS-82/10.25, September 1982. 38 p, 1 fig, 5 tab, 14 ref, 4 append.

Descriptors: *Habitat, *Fisheries, *Reservoir fisheries, *Mathematical models, *Fish harvest, Reservoirs, Fish, Lake fisheries, Regression analysis, Models, Model studies.

Habitat suitability index models were developed for selected coolwater and coldwater fishes in reservoirs. The models were based on estimates of harvest and were designed for use in existing and proposed coolwater and coldwater reservoirs in the contiguous United States. The analysis of reservoir harvest data consisted of development of multiple regression equations to predict harvest of selected fishes; conversion of these values to indices of habitat suitability; and exploration of discriminant analysis as an alternate quantitative approach. The feasibility of classifying reservoirs on the basis of grouped harvest of selected sport fishes, then predicting group membership based on environmental characteristics of a reservoir was also tested with discriminant analysis. The multiple regression equations presented herein are easily programmed to permit users to input environmental data and receive harvest and cumulative frequency values as output. The use of environmental factors to predict harvest in coolwater and coldwater reservoirs may remain relatively imprecise. Discriminant analysis did not produce precise classification schemes in reservoirs. Quantitative methods for identifying appropriate levels of harvest should be sought and tested before the procedure is abandoned. (Geiger-PTT)

RAINFALL-RUNOFF RELATIONSHIPS AND WATER-QUALITY ASSESSMENT OF COON CREEK WATERSHED, ANOKA COUNTY, MINNESOTA,
Geological Survey, St. Paul, MN. Water Resources Div.
A. D. Arntson, and L. H. Tornes.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4013, 1985. 97 p, 17 fig, 17 tab, 42 ref.

Descriptors: *Rainfall-runoff relationships, *Hydrograph modeling, Streams, Antecedent moisture, HEC-1, Water quality, Urbanization, Chemical properties, Biological properties, Regression techniques, Bottom materials, Loading, Sediment, Coon Creek, Anoka County, *Minnesota, Anoka Sand Plain.

Rainfall-runoff relationships were studied and a water-quality assessment was done for the 96.9-square-mile Coon Creek watershed, Anoka County, Minnesota. Data were collected from March 1979 to November 1980 at three continuously recording rainfall sites, five continuously recording streamflow sites, and seven creststage sites. Hydrograph analyses showed larger peak flows, shorter times to peak, and shorter duration of high flows in streams draining urban areas than in streams draining rural areas. Constrictions at roadways resulted in attenuation of hydrograph peaks in urban areas. Eight storms produced 19 hydrographs suitable for simulation with the HEC-1 model program. Parameter-optimization techniques were used to produce synthetic hydrographs that closely resemble observed hydrographs. Linear regression was used to relate rainfall and antecedent-moisture conditions in each of the subbasins to HEC-1 input parameters, resulting in generalized models that satisfactorily match 15 of 19 observed hydrographs. Water quality was determined from 1 bottom-material and 14 water samples from each of 4 sites. Results showed that urban runoff carried the highest areally adjusted loads of several metals, chloride, dissolved solids, and suspended sediment. The highest areally adjusted loads of most nutrients were found in mainstem segments of streams in rural areas. (USGS)

APPLICATION OF THE U.S. GEOLOGICAL SURVEY'S PRECIPITATION-RUNOFF MODELING SYSTEM TO THE PRAIRIE DOG CREEK BASIN, SOUTHEASTERN MONTANA,
Geological Survey, Helena, MT. Water Resources Div.
L. E. Cary.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4178, 1984. 98 p, 16 fig, 30 tab, 64 ref.

Descriptors: *Parametric hydrology, Hydrologic models, Model Studies, Model testing, *Rainfall-Runoff relationships, *Semiarid lands, Prairie Dog Creek basin, Tongue River basin, *Montana.

The U.S. Geological Survey's precipitation-runoff modeling system was tested using 2 year's data for the daily mode and 17 storms for the storm mode from a basin in southeastern Montana. Two hydrologic response unit delineations were studied. The more complex delineation did not provide superior results. In this application, the optimum numbers of hydrologic response units were 16 and 18 for the two alternatives. The first alternative with 16 units was modified to facilitate interfacing with the storm mode. A parameter subset was defined for the daily mode using sensitivity analysis. Following optimization, the simulated hydrographs approximated the observed hydrograph during the first year, a year of large snowfall. More runoff was simulated than observed during the second year. There was reasonable correspondence between the observed snowpack and the simulated snowpack the first season but poor the second. More soil moisture was withdrawn than was indicated by soil moisture observations. Optimization of parameters in the storm mode resulted in much larger values than originally estimated, commonly larger than published values of the Green and Ampt parameters. Following optimization, variable results were obtained. The results obtained are probably related to inadequate representation of basin infiltration characteristics and to precipitation variability. CALIBRATION PROCEDURE FOR A DAILY FLOW MODEL OF SMALL WATERSHEDS WITH SNOWMELT RUNOFF IN THE GREEN RIVER COAL REGION OF COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
J. M. Norris, and R. S. Parker.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 83-4263, 1985. 32 p, 18 fig, 8 tab, 10 ref.

Descriptors: *Model studies, *Snowmelt, *Calibrations, Soil water, *Runoff prediction, *Colorado, *Precipitation-Runoff Modeling System.

A calibration procedure was developed for the U.S. Geological Survey's Precipitation-Runoff Modeling System for watersheds in which snowmelt is the major contributor to runoff. The model uses daily values of air temperature and precipita-

tion as input and the output is mean daily discharge. The procedure appears sufficient to calibrate both streamflow volume and the timing of mean daily discharge if other model parameters are reasonably estimated. Model structure and sensitivity analysis suggest that one of the most important parameters is the available water-holding capacity of the soil (SMAX). Changing this parameter through a series of iterations, the calibration procedure minimizes the error between observed and predicted annual discharge. The calibration suggests that the single parameter SMAX may be sufficient for optimizing both the volumes and the timing of runoff, assuming other model parameters are adequately estimated. Additional optimization on parameters sensitive to timing does not appear to improve prediction. This indicates that these parameters were estimated accurately prior to calibration. Further investigation is needed on more watersheds to determine SMAX's ability to calibrate volume and timing with a constant set of other model parameter values. (USGS)

SCPP DATA COLLECTION AND ANALYSIS FOR THE PERIOD 1 JANUARY 1979 THROUGH 30 SEPTEMBER 1984: VOLUME ONE - EXECUTIVE SUMMARY,
Atmospherics, Inc., Fresno, CA..
Final Report, September 1984. 35 p, 1 fig. 9-07-85-V0020.

Descriptors: *Weather modification, *Precipitation, *Data collections, Orographic precipitation, Supercooling, Meteorological data collections, Cloud physics, Cloud seeding, *Sierra Cooperative Pilot Project, Sierra Nevada Mountains, Measuring instruments, Snow, Ice, *California.

This volume (1 of 3) briefly summarizes all weather modification data collection and analysis tasks performed by Atmospherics Incorporated during the period 1 January 1979 through September 1984 within the Sierra Cooperative Pilot Project. The major categories of work included the installation, operation, and maintenance of, plus data collection and analysis from (1) a network of precipitation gages, (2) ground-based instrumentation for the detection of supercooled liquid water, (3) a network of surface meteorological stations, (4) a fixed microphysics station, (5) snow and high-volume air samplers and (6) NCAR Ice Nucleus counters. Summaries of work performed during the six seasons of field activities, including data acquition, data processing, instrument calibration, and maintenance and anlaysis efforts, are presented. THUDERSTORMS: A SOCIAL, SCIENTIFIC, AND TECHNOLOGICAL DOCUMENTARY. VOLUME 3: INSTRUMENTS AND TECHNIQUES FOR THUNDERSTORM OBSERVATION AND ANALYSIS.
National Oceanic and Atmospheric Administration, Boulder, CO. Environmental Research Labs.
Available from the National Technical Information Service, Springfield, VA 22161 as PB83-146076, Price codes: A14 in paper copy, A01 in microfiche.
April 1982. Edited by Edwin Kessler. 313 p.

Descriptors: *Thunderstorms, *Radar, *Data acquisition, *Satellite technology, *Meteorological data collections, Storms, Tornadoes, Rainstorms, Photogrammetry, Hail, Networks, Acoustics, Data collections, Weather data collections, Instrumentation, Networks.

This third and last volume of a comprehensive documentation of thunderstorms presents tools and techniques for acquisition and analysis of data on thunderstorms. Topics covered include: station networks for storm observation, tornado interception with mobile teams, observations from instrumented aircraft, photogrammetry of thunderstorms, storm acoustics, infrasound from thunderstorms, sferics and other electrical techniques for storm investigations, observation and measurement of hailfall, and the use of satellite observations. An appendix to the chapter on measuring storm rainfall is included which provides mathematical equations to adjust for various biases caused by receivers, rainfall, attenuation, clouds and atmospheric gases. HYDROLOGY OF AREA 11, EASTERN C PROVINCE, OHIO, KENTUCKY, AND V VIRGINIA,
Geological Survey, Columbus, OH. Wate sources Div.
D. K. Roth, and S. C. Cooper.
Available from OFSS, USGS, Box 25425 wood, CO 80225. USGS Water-Resources In gations Report 84-233, 1984. 66 p, 45 fig, 4 t ref.

Descriptors: *Coal Mines, *Environmental E Mine Drainage, Water Quality, Erosion, Sed tation, *Eastern Coal Province, *Ohio, Kent West Virginia.

The Eastern Coal Province is divided in separate hydrologic reporting areas. The di is based on hydrologic factors, location, size mining activity. Area 11 of the Eastern Coal ince comprises 3,190 square miles of southea Ohio, northeastern Kentucky, and western V ia. Except for the wide, flat flood plain alon Ohio River, it consists mainly of rolling hills. of the area is forested. Precipitation in the ranges from 39 inches per year in the north inches per year in the south. Coal seams 1 to thick are found in rocks of Pennsylvanian ag crop out in Area 11. Surface mining of c concentrated in the Ohio part; surface mine scattered throughout the Kentucky part, and are no known mines in the West Virginia Most of the streams that drain less than 100 s miles normally approach zero flow from late through October. The average value of th percent daily duration flow (based on eigh tions) is 0.37 cubic feet per second per square The 2-year flood-peak magnitude (based on stations) ranges from 10.8 to 138 cubic fee second per square mile; the average 2-year peak is 43.8 cubic feet persecond per square The pH of sampled streams ranged from 2.6 t The median pH at mined sites was 5.4 where median pH at unmined sites was 7.3. Disso iron concentrations ranged from 0 to 150,00 crograms per liter; medians were 893 microg per liter at mined sites and 90 micrograms pe at unmined sites. Sulfate concentrations ra from 9.8 to 2,100 milligrams per liter; me were 203 milligrams per liter at mined sites a milligrams per liter at unmined sites. Alth water wells in alluvium along the Ohio produce up to 1,500 gallons per minute, bed wells throughout most of Area 11 typically only 1 or 2 gallons per minute. Chemical ana of ground water indicate that bicarbonate i major anion in Area 11; calcium and sodium the major cations. (USGS)

EVALUATION OF RAINFALL-RUNOFF D FOR THE DENVER FEDERAL CENT LAKEWOOD, JEFFERSON COUNTY, CO RADO,
Geological Survey, Lakewood, CO. Water sources Div.
R. D. Jarrett, and J. E. Veenhuis.
Available from OFSS, USGS Box 25425 L wood, CO 80225. USGS Water-Resources Inv gations Report 84-4050, 1984. 67 p, 11 fig, 7 ta ref.

Descriptors: *Storm runoff, *Streamflow, W management, *Rainfall-runoff relations, *Hy graph analysis, *Floods, Flow discharge, Thun storms, Streamflow gages, Rain gages, Data lections, Stage-discharge relations, *Colorado, ferson County, Lakewood, Denver Fed Center.

An investigation was made to monitor the st runoff in McIntyre Gulch basin to determine rainfall-runoff chracteristics. Results may now used to evaluate the effects of future developr

on storm runoff from the Denver Federal Center, which is located in the McIntyre Gulch basin in Lakewood, CO. Rainfall and runoff data were collected at eight streamflow stations and three auxiliary rainfall stations in and adjacent to the Denver Federal Center. The outflow peak discharges from McIntyre Gulch in the Denver Federal Center were higher than the inflow peak discharges for eight of the storms by an average of 38 ercent. Outflow peak discharges for eight of the torms were lower by an average of 12 percent. The study demonstrated that runoff varies with ocation of a storm--even for a relatively small asin. Peak discharges of McIntyre Gulch outflow om the Denver Federal Center were 27 percent reater than the inflow for all storms, but only 15 ercent greater for evenly distributed storms. unoff from the Denver Federal Center increased orm-runoff volumes in McIntyre Gulch by an verage of 46 percent. Proper management of orm runoff in the Denver Federal Center reires that proposed improvements to the existing orm-runoff system maintain peak flows at their esent levels. (USGS)

EAMFLOW ROUTING IN THE SCHORIE CREEK BASIN, NEAR NORTH BLENM, NEW YORK,
ogical Survey, Albany, NY. Water Resources

. Wolcott.
lable from OFSS, USGS Box 25425 Lake, CO 80225. USGS Water-Resources Investins Report 84-4054, 1983. 20 p, 4 fig, 3 tab, 7 ref.

Descriptors: *Flood Routing, *River Forecasting, *Model Studies, Historic Flood, Hydrographs, *New York, Schoharie Creek, HEC-1 model.

A flow-routing model of the upper Schoharie Creek basin, New York, was developed and used to simulate high flows at the inlet of the Blenheim-Gilboa Reservoir. The flows from Schoharie Creek at Prattsville, the primary source of flow data in the basin, and tributary flows from the six minor basins downstream, are combined and routed along the 9.7 mile reach of the Schoharie Creek between Prattsville and the reservoir inlet. Data from five historic floods were used for model calibration and four for verification. The accuracy of the model as measured by the difference between simulated and observed total flow volumes, is within 14 percent. Results indicate that inflows to the Blenheim-Gilboa Reservoir can be predicted approximately 2 hours in advance. One of the historical floods was chosen for additional model testing to assess a hypothetical real-time model application. Total flow-volume errors ranged from 30.2 percent to -9.2 percent. Alternative methods of obtaining hydrologic data for model input are presented for use in the event that standard forms of hydrologic data are unavailable. (USGS)

ASSESSMENT OF WATER RESOURCES AT FORT CARSON MILITARY RESERVATION NEAR COLORADO SPRINGS, COLORADO,
Geological Survey, Pueblo, CO. Water Resources Div.
G. J. Leonard.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 83-4270, 1984. 124 p, 21 fig, 18 tab, 32 ref.

Descriptors: *Surface water, *Groundwater, *Water quality, *Colorado, El Paso County, Fort Carson Military reservation, Arkansas River Valley, Front Range Urban Corridor, Water supply, Data collections.

The Fort Carson Military Reservation adjoins the rapidly growning Colorado Springs metropolitan area, where locally available water supplies are limited and strictly administered. Fort Carson purchases about 3,400 acre-feet of treated water annually from the city of Colorado Springs. The major streams entering Fort Carson have an estimated average annual discharge of 6,240 acre-feet of water per year upstream from diversions for municipal and domestic water supplies. The streamflow is unevenly distributed in time and consequently not dependable as a large or sole source of water. Ground water is available from alluvial and bedrock aquifers. Wells with yields greater than 100 gallons per minute can be expected from the alluvium along Rock and Little Fountain Creeks and from some parts of the Dakota-Purgatoire aquifer. The quality of surface water entering Fort Carson is generally suitable for irrigation and drinking but deteriorates eastward across Fort Carson. Water from the alluvial aquifer along Rock and Little Fountain Creeks in the eastern part of Fort Carson contains fluoride in concentrations exceeding drinking-water standards. Water from the Dakota-Purgatoire aquifer characteristically contains radiochemical constituents in concentrations that exceed drinking-water standards. (USGS)

MAGNITUDE AND FREQUENCY OF FLOOD VOLUMES FOR URBAN WATERSHEDS IN LEON COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
M. A. Franklin.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4233, 1984. 20 p, 2 fig, 5 tab, 32 ref.

Descriptors: *Regression analysis, *Flood recurrence interval, *Rainfall-runoff, *Unit hydrograph, Data collections, *Leon County, *Florida.

Techniques are provided for estimating runoff magnitudes for urban-flow streams in Leon County, Florida, for recurrence intervals of 2, 5, 10, 25, 50, 100, and 500 years. Synthetic runoff volumes were generated by using a calibrated lumped-parameter rainfall-runoff model, pan evaporation data from Milton, Florida, and long-term unit rainfall records from Thomasville-Coolidge, Georgia, and Pensacola, Florida. The synthetic runoff volumes were used to develop station runoff-frequency relations which were used in multiple linear regression analyses to derive regional equations relating runoff to basin characteristics. The significant basin characteristic was impervious area. The average standard error of regression was + or - 16 percent for all recurrence intervals except the 2-year, + or - 18 percent and the 500-year + or - 17 percent. (USGS)

FLOODS OF APRIL 18, 1983 ON ST. THOMAS AND ST. JOHN, U.S. VIRGIN ISLANDS,
Geological Survey, San Juan, PR. Water Resources Div.
R. E. Curtis.
Available from OFSS, USGS, Box 25425 Lake-

wood, CO 80225. USGS Water-Resources Investigations Report 84-4184, 1984. 12 p, 6 fig, 1 tab, 4 ref.

Descriptors: *Flood flow, Flood frequency, Peak flow, Flood profiles, Excess rainfall, Flood damage, *U.S. Virgin Islands, *St. Thomas, *St. John.

The U.S. Virgin Islands of St. Thomas and St. John experienced the most intense rainfall event in recorded history on April 18, 1983. Rainfall intensities of 2.5 inches per hour, and more than 16 inches in 18 hours were recorded. Almost instantaneous runoff caused widespread flood near the coastlines of both islands. Parts of Charlotte Amalie in St. Thomas were inundated with 4 feet or more of mud and flood water. Harry S. Truman Airport was flooded for 2 days with 2 to 3 feet of ponded water. On St. John, rural areas near Guinea Gut, Fish Bay, and Coral Bay were flooded. (USGS)

HYDROLOGY OF PRAIRIE DOG CREEK VALLEY, NORTON DAM TO STATE LINE, NORTH-CENTRAL KANSAS,
Geological Survey, Garden City, KS. Water Resources Div.
L. E. Stullken.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4162, 1985. 49 p, 11 fig, 2 tab, 17 ref.

Descriptors: Hydrology, Steady-state model, Groundwater flow, Recharge, Discharge, Base flow, *Hydrogeology, Surface-groundwater relationships, Model studies, *Prairie Dog Creek Valley, *Kansas.

Development of water resources has been a major factor in the economy of Prairie Dog Creek valley in north-central Kansas. Releases from Norton reservoir to the Almena Irrigation District averaged 6,900 acre-feet per year during 1967-76. The number of irrigation wells increased from 4 to 147 during 1947-78. Ground water in the valley is derived mostly from the alluvial aquifer. The effects of irrigation on the aquifer are indicated by water-level changes. The water in storage increased from 130,000 to 136,000 acre-feet during 1947-78 due to recharge from surface-water irrigation. A steady-state model of the aquifer prior to irrigation (1947) indicated that most recharge was from precipitation (88 percent) and most discharge was to streams (54 percent) and evapotranspiration (26 percent). Although aquifer storage increased in this area, storage generally decreased in other areas of western Kansas. (USGS)

WATER RESOURCES OF THE COTTONWOOD WASH WATERSHED, UTE MOUNTAIN, UTE INDIAN RESERVATION, SOUTHWESTERN COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
A. L. Geldon.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 85-4027, 1985. 56 p, 13 fig, 10 tab, 48 ref.

Descriptors: Watersheds, Intermittent streams, *Alluvial aquifers, *Springs, *Water supply, *Water quality, Hydrologic budget, *Groundwater-surface water relations, *Colorado, Montezuma County, *Four Corners area, Ute Mountain, Ute Indian Reservation, Towaoc, Cottonwood Wash, Sleeping Ute Mountain.

Cottonwood Wash, near Towaoc, Colorado, is a 16-square-mile watershed with an estimated average annual precipitation influx of 14,600 acre- Most of this water is consumed by evapotrans tion. Except for snowmelt in the spring mo and infrequent rain storms, all flow in the wa from springs issuing from talus, block rubble, vium, colluvium, and Mancos Shale. Flow is g est during the spring months when the groun saturated from snowmelt and least during the e fall when many springs cease flowing. Most o water in the wash upstream from Towaoc i verted to Cottonwood Reservoir. Springs in wash downstream from Towaoc are distribut Most of the water from these springs, howe seeps back into the alluvium. One of these spr supplies about 19 acre-feet of water per yea Towaoc. The cumulative flow from 17 springs diffuse seepage was about 290 acre-feet in the water year. The quantity of recoverable wate the younger of two pediment deposits is a 2,000 to 4,000 acre-feet, depending on seasonal yearly variations in precipitation. Estimated un flow from the wash in the 1982 water year was acre-feet; estimated recharge to bedrock was acre-feet. Water from block rubble and talu suitable for most purposes; water from Mar Shale and alluvium may contain concentration dissolved solids that are unacceptable for dome use. (USGS)

STATISTICAL MODELS FOR ESTIMATI FLOW CHARACTERISTICS OF MICHIG STREAMS,
Geological Survey, Lansing, MI. Water Resour Div.
D. J. Holtschlag, and H. M. Croskey.
Available from OFSS, USGS, Box 25425, La wood, CO 80225. USGS Water-Resources Inve gations Report 84-4207, 1984. 80 p, 8 fig, 15 tab, ref.

Descriptors: *Regression analysis, *Estimat equations, *Flow characteristics, River basins, H drometeorology, Average flow, Low flow, Du tion curves, Peak discharge, Regional analy *Michigan, *Statistical models.

Multiple-regression equations provide statisti models to estimate flow characteristics at ungag sites in Michigan. The equations require determi tion of several readily measureable basin and m tereological characteristics and an areal adjustm factor. Flow characteristics for which estimati equations have been prepared include mean a mean monthly flow, flow-duration, low flow, pe discharge, and flood volume. The precision of flow estimate varies with the flow characterist being estimated and the basin characteristics ha the lowest standard errors, whereas peak flow a low flow characteristics have the highest standa errors. Sites that have basin characteristics simi to the basin characteristics used to develop regression equations can be estimated more p cisely. Confidence limits can be computed abo the estimates using information included in t report. Need for additional gaging stations is sumed to be proportional to the standard error residuals found among five regions designated Michigan. Additional continuous-record statio may be most beneficial in region 3 for reducing t standard error of mean and mean monthly flo equations. Additional partial-record stations m be useful in region 4 for reducing the standa error of low flow and peak flow estimates. (USG

POTENTIOMETRIC SURFACE OF THE UPPER FLORIDAN AQUIFER, WEST-CENTRAL FLORIDA, MAY 1985,
Geological Survey, Tampa, FL. Water Resources Div.
. L. Barr.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Open-File Report 85-482, 1985. 1 p, 2 fig, 2 ref.

Descriptors: *Potentiometric level, Potentiometric flow, Hydrology, Hydrogeology, *Florida, *Maps.

A May 1985 potentiometric surface map of the Upper Floridan aquifer in west-central Florida depicts the annual low water-level period. Most areas of west-central Florida were experiencing drought conditions and water levels were at or approaching near-record low levels. Water levels in most wells measured in May 1985 were lower than in September 1985. May levels averaged about 5 feet lower than September levels in areas north of latitude 28 degrees 07' and about 13 feet lower in southern areas. Generally, water levels in May 1985 averaged about 4 feet lower than May 1984 levels in the north and about 6 feet lower in the south. (USGS)

MAPS SHOWING GROUND-WATER LEVELS, SPRINGS, AND DEPTH TO GROUND WATER, BASIN AND RANGE PROVINCE, SOUTHERN CALIFORNIA,
Geological Survey, Lakewood, CO. Water Resources Div.
. H. Langer, W. R. Moyle, L. R. Woolfender, and D. A. Mulvihill.
Available from OFSS, USGS BOX 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 83-4116-B, 1983. 6 p, 3 fig, 40 ref.

Descriptors: *Groundwater levels, *Springs, Hydrogeology, *Groundwater data, Basin and Range Province, *California.

This map report is part of a U.S. Geological Survey project to characterize the geology and hydrology of the Basin and Range province. The report consists of two maps describing selected hydrologic properties of the southern California part of the Basin and Range province. The first map, at a scale of 1:500,000, shows the approximate altitude of the water table, and the location, temperature, and flow of large springs. The altitude of the water table is shown by contours where sufficient data exists; otherwise it is shown by data points. Springs with flows of 10 gallons per minute or more have been mapped. A second map at a scale of 1:1,000,000 shows the depth to ground water and areas of basin fill or consolidated rocks. In areas where the depth to ground water is less than 500 feet, the depth is shown by lines of equal depth to water or data points where data are insufficient to draw lines. Areas are shaded where the depth to the water table is generally greater than 500 feet. (USGS)

GEOHYDROLOGY OF VOLCANIC TUFF PENETRATED BY TEST WELL UE-25BNO1, YUCCA MOUNTAIN, NYE COUNTY, NEVADA,
Geological Survey, Lakewood, CO. Water Resources Div.
R. G. Lahoud, D. H. Lobmeyer, and M. S. Whitfield.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4253, 1984. 44 p, 25 fig, 5 tab, 24 ref.

Descriptors: *Nevada, *Radioactive waste disposal, *Water levels, Hydrogeology, *Hydrologic properties, Igneous rocks, *Yucca Mountain, Nevada Test Site.

Test well UE-25bNo1, located on the east side of Yucca Mountain in the southwestern part of the Nevada Test Site, was drilled to a total depth of 1,220 meters and hydraulically tested as part of a program to evaluate the suitability of Yucca Mountain as a nuclear-waste repository. The well penetrated almost 46 meters of alluvium and 1,174 meters of Tertiary volcanic tuffs. The composite hydraulic head for aquifers penetrated by the well was 728.9 meters above sea level (471.4 meters below land surface) with a slight decrease in loss of hydraulic head with depth. Average hydraulic conductivities for stratigraphic units determined from pumping tests, borehole-flow surveys, and packer-injection tests ranged from less than 0.001 meter per day for the Tram Member of the Crater Flat Tuff to 1.1 meters per day for the Bullfrog Member of the Crater Flat Tuff. The small values represented matrix permeability of unfractured rock; the large values probably resulted from fracture permeability. Chemical analyses indicated that the water is a soft sodium bicarbonate type, slightly alkaline, with large concentrations of dissolved silica and sulfate. Uncorrected carbon-14 age dates of the water were 14,100 and 13,400 years. (USGS)

HYDROGEOLOGY AND EFFECTS OF TAILINGS BASINS ON HYDROLOGY OF SANDS PLAIN, MARQUETTE COUNTY, MICHIGAN,
Geological Survey, Lansing, MI. Water Resources Div.
N. G. Grannemann.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4114, 1984. 98 p, 31 fig, 21 tab, 32 ref.

Descriptors: *Hydrogeology, Groundwater recharge, Groundwater movement, Groundwater runoff, *Surface water - groundwater relationships, Obstruction to flow, Hydraulic conductivity, Leakage, Computer models, Marquette Iron Range, Marquette County, *Michigan.

A hydrogeological study of Sands Plain, a sandy outwash area in the north-central part of Michigan's Upper Peninsula, was conducted during 1979-82. Parts of the area are being considered as possible sites for construction and operation of iron mining tailings basins. Gribben Basin, an existing tailings basin in the western part of Sands Plains, covers 2.5 square miles; hypothetical tailings basins may cover as much as 11 square miles. Glacial deposits are the area's principal aquifer. The general direction of ground-water flow is from the outwash area toward Lake Superior. Before reaching Lake Superior, however, most ground water is discharged in a series of nearly parallel streams. Ground water accounts for 95 percent of the discharge of these streams. Precipitation collected at two sites had average pH values of 4.0. Dissolved solids concentrations in water from wells ranged from 41 to 246 milligrams per liter; in water from streams, they ranged from 82 to 143 milligrams per liter. Calcium and bicarbonate were the principal dissolved ions. A two-dimensional digital model of ground-water flow was used to simulate ground-water levels and runoff. The predictive computer simulations indicate that construction and operation of Gribben tailings basin, located in the western part of the study area, decreased ground-water flow to Goose Lake Outlet by 0.9 to 1.6 cubic feet per second. Construction and operation of four hypothetical tailings basins covering a total of 11 square miles is estimated to reduce ground-water flow to the area's streams by 7 to 18 cubic feet per second depending on the hydraulic properties of material comprising the basin boundaries. Leakage from all of the basins is estimated to range from 0.7 to 7 cubic feet per second. (USGS)

GROUND-WATER HYDROLOGY OF VOLUSIA COUNTY, FLORIDA, WITH EMPHASIS ON OCCURRENCE AND MOVEMENT OF BRACKISH WATER,
Geological Survey, Orlando, FL. Water Resources Div.
A. T. Rutledge.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4206, 1985. 84 p, 42 fig, 6 tab, 19 ref.

Descriptors: Brackish water, *Saltwater intrusion, *Drawdown, *Freshwater-saltwater interface, *Saline water intrusion, Path of pollutants, *Florida, Volusia County.

Brackish water is present in the eastern and western fringes of Volusia County, Florida in the surficial aquifer and in the Floridan aquifer system. Average pumpage in 1980 in Volusia County was 66 million gallons per day. Water levels in the Floridan aquifer system declined more than 10 feet over an area of 70 square miles from 1955 to 1982. The annual water budget of the budget of the Floridan aquifer system consists of 5 inches downward leakage inflow, 1 inch upward leakage outflow, 1 inch horizontal inflow, 1.5 inches horizontal outflow, 2.5 inches discharge from springs and flowing wells, and 1 inch pumpage. Saltwater intrusion is occurring in the surficial aquifer on the barrier island. There is little evidence that intrusion is occurring uniformly over large areas in the Floridan aquifer system. Vertical intrusion is occurring at sites of public-supply pumping. Many of these wells in the fringes of the county have been abandoned and replaced by wells closer to the central part of the county. Minimizing well depth is probably the single most effective step against intrusion. (USGS)

USE OF DOUBLE-MASS CURVES TO DETERMINE DRAWDOWN IN A LONG-TERM AQUIFER TEST IN NORTH-CENTRAL VOLUSIA COUNTY, FLORIDA,
Geological Survey, Orlando, FL. Water Resources

Div.
A. T. Rutledge.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4309, 1985. 29 p, 17 fig, 1 tab, 10 ref.

Descriptors: Drawdown, Aquifer test, Capture, Double-mass curve, Leakage, *Groundwater levels, Water yield, *Florida, Volusia County.

A test well withdrew water from the upper Floridan aquifer system at an average of 530 gallons per minute from June 1978 to July 1979. Ground-water levels were monitored in wells open to the upper Floridan (artesian) aquifer system and in wells open to the surficial (water-table) aquifer. Double-mass curves were used to separate drawdown from natural water-level fluctuations. Drawdowns in the Floridan were 4.3 feet at a site 350 feet away from the pumped well, 4.1 feet at a site 1,000 feet away, 1.0 foot at a site 1.0 mile away, and 0.4 foot at a site 5.8 miles away. After an initial drawdown of 0.2 foot at a surficial aquifer well 1,000 feet from the pumped well, there was some recovery, and long-term drawdown averaged less than 0.2 foot. In a five-day aquifer test during a period of no rainfall in 1976, the ratio of surficial aquifer drawdown to Floridan aquifer system drawdown reached equilibrum at 0.05. The results of the long-term test indicate that this ratio is the upper limit of long-term drawdown because of capture of evapotranspiration and runoff during the long-term test. (USGS)

POTENTIOMETRIC MAP OF THE PALEOZOIC AQUIFER IN NORTHEASTERN MISSISSIPPI, NOVEMBER AND DECEMBER 1982,
Geological Survey, Jackson, MS. Water Resources Div.
D. Darden.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 83-4254, 1984. 1 sheet, 3 fig, 6 ref.

Descriptors: *Potentiometric map, *Water level, Groundwater, Aquifers, Hydrogeology, *Mississippi, Paleozoic rock.

The Paleozoic rocks that outcrop in Tishomingo County, Mississippi, supply water to public, industrial, and domestic wells in two counties in the northeastern part of the State. Paleozoic rocks in the area consist mostly of beds of sandstone, shale, and limestone which dip about 30 feet per mile to the southwest. The potentiometric surface of the Paleozoic aquifer slopes generally to the west away from the area of outcrop and is strongly affected by large groundwater withdrawals at Corinth. The water level at Corinth has declined about 160 feet from 1954 to 1974 and recovered about 45 feet by 1982. Wells that were near the center of the cone of depression have been replaced by new wells located away from the center. (USGS)

POTENTIOMETRIC SURFACE MAP OF THE ALLUVIAL AQUIFER, EASTERN ARKANSAS, SPRING 1983,
Geological Survey, Little Rock, AR. Water Resources Div.
J. Edds, and D. J. Fitzpatrick.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4264, 1984. 1 sheet, 5 fig, 7 ref.

Descriptors: Potentiometric level, *Water level, Hydraulic gradient, *Arkansas, *Missippi River alluvial aquifer, *Arkansas County, *Poinsett County.

The Mississippi River Alluvial Aquifer is a major source of water supply for irrigation in much of eastern Arkansas. Hydrologic maps of the potentiometric surface, water-level changes and depths to water in the aquifer, based on Spring 1983 measurements, are presented. The Mississippi River Alluvial Aquifer is comprised of Quaternary alluvial flood-plain and terrace deposits. The aquifer generally is partially-confined. Recharge to the aquifer is principally through precipitation and surface-water bodies. The potentiometric surface map indicates two cones of depression occurring in the aquifer beneath Arkansas, Poinsett, and Cross Counties as a result of heavy pumpage within these areas. A comparison of water-level data from 1982 and 1983 shows water levels in the aquifer generally decreasing in the area within the cones of depression. Water levels generally increased in the remainder of the area south and west of the White River, and along the Mississippi River. A map showing the depth to water below land surface indicates that water levels are generally shallowest near the Mississippi River and the Fall Line and deepest within the cone of depression. (USGS)

Descriptors: *Potentiometric level, *Groundwater levels, Groundwater, Water levels, *Arkansas, *Sparta Sand aquifer, *Memphis Sand aquifer.

The Sparta Sand and the Memphis Sand aquifers are a major source of industrial and public water supply and a minor but locally significant source of water for agricultural purposes in eastern and south-central Arkansas. The potentiometric surface map for this aquifer, compiled from water-level measurements made during the spring of 1983, indicates a generally southward potentiometric gradient. The potentiometric surface also illustrates the existence of three major cones of depression; one centered in Columbia County, one in Union County, and one in Jefferson County. Within the cones of depression, the majority of water
drawn is utilized for industrial and public su

The disposal of municipal and industrial wastes
or at shallow depths below land surface can res
in contamination of ground water--the source

drinking water for more than 90 percent of Florida's residents. This threat to public health has resulted in new State groundwater regulations. Knowledge of the ability of surficial deposits to retard movement of contaminants is important to the implementation of these regulations. This map report shows areas where beds of at least 10 feet thickness with a hydraulic conductivity (saturation) of less than 0.1 foot per day occur within 50 feet below land surface, based mainly on interpretations of lithology. The map is intended as a guide for making preliminary assessments and should not be considered definitive of permeability beneath a specific site. Available determinations of hydraulic conductivities of surficial deposits in Florida are shown in table format. (USGS)

Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 83-4082, 1984, 78 p, 4 fig, 4 tab, 10 ref.

Descriptors: Wells, Springs, *Water Quality, Well logs, Geology, Hydrology, Well yield, Precipitation, *Groundwater, Surface water, Water supply, Water yield, *California, Fenner, Lanfair, San Bernardino County.

Lanfair and Fenner Valleys and vicinity cover about 1,300 square miles in eastern San Bernardino County, California. Average annual precipitation ranges from 3 to 10 inches over the area. Ground water is utilized primarily for stock and domestic purposes, and occurs in the unconsolidated deposits as well as in the highly fractured consolidated rock. Ground-water levels in wells range from 5 to 0 feet below land surface, and well yields range from 3 to 1,200 gallons per minute throughout the study area. Records indicate that water levels are at or near their predevelopment levels. Springs occur along faults and formational contacts and generally discharge less than 5 gallons per minute. Measured ground-water outflow from Lanfair Valley at Piute Spring ranged from 100 to 630 acre-feet per year. Most of the water is of good quality for domestic and stock use. However, water from two wells indicates a concentration of sulfate that is above the recommended limit for drinking water. Water supplies are adequate for present needs. However, large-scale pumping would result in the lowering of the water table and a reduction of the ground water in storage. (USGS)

JANUARY 1984 WATER LEVELS, AND DATA RELATED TO WATER-LEVEL CHANGES, WESTERN AND SOUTH-CENTRAL KANSAS,
Geological Survey, Lawrence, KS. Water Resources Div.
M. E. Pabst, and B. J. Dague.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Open-File Report 84-613, 1984. 163 p, 2 fig, 1 tab, 15 ref.

Descriptors: *Groundwater, Water-level changes, *Hydrologic data, *Kansas, Data collections.

Water-level measurements were made, mostly during January 1984, in about 1,450 wells in western and south-central Kansas. The measurements were made in mid-winter when pumping was minimal and water levels had recovered, for the most part, from the effects of pumping during the previous irrigation season. Annual hydrologic data are provided for relating water-level changes from a 'base-reference year' (predevelopment year), a year of abnormally high rainfall and minimum pumpage (1966 or 1974), and each of 7 consecutive years of measurement (1978-84). The 'base-reference year' is designated as 1940 for the southwestern area, 1944 for the south-central area, and 1950 for the northwestern and west-central areas. Water levels for the 'base-reference year' are established by measurements made during that year and by interpretation of maps showing water-level altitudes. Data also are provided for relating the average annual water-level changes, saturated thicknesses of the deposits, and percentage changes in saturated thicknesses.
W86-01960

AVAILABILITY AND CHEMISTRY OF GROUND WATER ON THE BRUNEAU PLATEAU, SOUTH-CENTRAL IDAHO,
Geological Survey, Boise, ID. Water Resources Div.
R. L. Moffatt, and M. L. Jones.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4065, 1984. 88 p, 15 fig, 7 tab, 31 ref.

Descriptors: Available groundwater, Available water, *Ground-water availability, *Groundwater irrigation, Available irrigation water, Bruneau plateau, *Idaho, *Groundwater chemistry.

The Bruneau plateau in south-central Idaho consists of about 889,600 acres of potentially irrigable land. About 112,200 of these acres have been developed for agriculture; 11,200 acres are irrigated with ground water, and the remaining acreage is irrigated with water from the Snake and Bruneau rivers and Salmon Falls Creek. On the basis of present usage, about 158,000 acre-feet of water per year are needed to develop an additional 63,000 acres. About 438,000 acre-feet per year are needed to irrigate existing and newly developed lands in dry years when streamflow in the Snake River at Milner Dam is inadequate to meet appropriated needs. Pumping lifts of about 400-600 feet and low well yields on the Bruneau plateau probably preclude large-scale irrigation development solely from local ground-water resources. However, supplemental sources of irrigation water are available from a perched-water aquifer, a thermal aquifer, and the regional aquifer adjacent to the plateau. About 100,000-115,000 acre-feet per year of water probably could be withdrawn from the perched and regional aquifers and conveyed to the plateau without serious impact on local ground-water resources. The amount of water that could be safely withdrawn from the thermal aquifer was not determined. (USGS)

GROUND-WATER LEVEL DATA AND PRELIMINARY POTENTIOMETRIC-SURFACE MAPS, YUCCA MOUNTAIN AND VICINITY, NYE COUNTY, NEVADA.
Geological Survey, Lakewood, CO. Water Resources Div.
J. H. Robison.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4197, 1984. 20 p, 2 fig, 1 tab, 2 ref.

Descriptors: *Ground-water level, *Potentiometric level, Hydrologic maps, *Nevada, Nye County, Yucca Mountain, Hydrologic data.

The report contains a table of ground-water level data and two preliminary potentiometric-surface maps for the Yucca Mountain area. The water-level surface shown on the maps generally represents water-table (unconfined) conditions. The water table in the Yucca Mountain area occurs in ash-flow and air-fall tuffs of tertiary age. West of the crest of Yucca Mountain, water-level altitudes are about 775 meters above sea level. Along the eastern edge and southern end of Yucca Mountain, the potentiometic surface generally is nearly flat, is about 728 to 730 meters above sea level, and has a southeastward slope. (USGS)

Descriptors: *Groundwater levels, *Springs, Aquifers, Maps, *Basin and Range province, *Arizona.

This map report is part of a U.S. Geological Survey project to characterize the geology and hydrology of the Basin and Range province. The report consists of two maps describing selected hydrologic properties of the Arizona part of the Basin and Range province. The first map, at a scale of 1:500,000, shows the approximate altitude of the ground-water table, and the location, temperature, and flow of large springs. The altitude of the ground-water table is shown by contours where sufficient data exists; otherwise it is shown by data points. Springs with flows of 10 gallons per minute or more have been mapped. A second map at a scale of 1:1,000,000 shows the depth to ground water and areas of basin fill or consolidated rocks. In areas where the depth to ground water is less than 500 feet, the depth is shown by lines of equal depth to ground water or data points where data are insufficient to draw lines. Areas are shaded where the depth to the ground water table is generally greater than 500 feet. (USGS)

GROUNDWATER MANAGEMENT STRATEGY FOR MICHIGAN GROUNDWATER MODELING: SELECTION, TESTING AND USE,
Michigan Dept. of Natural Resources, Lansing.
D. A. Hamilton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB83-143214, Price codes: A08 in paper copy, A01 in microfiche. Volume 2: Appendices, September 1982. 174 p.

Descriptors: *Groundwater management, *Models, *Aquifers, *Groundwater movement, *Groundwater pollution, Model studies, Path of pollutants, Fate of pollutants, Landfills, Hydrologic models, Finite element method, Mathematical models.

This volume is comprised of four appendices. The first describes an assessment of the two-dimensional flow model at the Southwest Ottawa County Landfill. The two-dimensional methodology used at the site should be applicable to similar sites. The second appendix describes an investigation of contaminant transport parameters in Michigan Aquifers. The third appendix discusses aquifer dispersivities from field data with examples of contaminant transport in Michigan aquifers. The fourth appendix deals with a groundwater management strategy for Michigan using finite-element modelling of contaminant transport. The strategy uses the finite element groundwater/transport model GEOFLOW. The utility and accuracy of GEOFLOW is demonstrated by comparison with an analytical solution and by modeling an idealized flow situation. Further refinement of GEOFLOW would be achieved by delineating a more localized flow region effecting a smaller grid and accompanying Peclet number. (Geiger-PTT)

RELATIONSHIP OF LABORATORY AND FIELD DETERMINED HYDRAULIC CONDUCTIVITY IN COMPACTED CLAY SOILS,
Agricultural Research Service, University Park, PA. Northeast Watershed Research Center.
A. S. Rogowski, and E. B. Richie.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 520-533, 2 fig, 25 ref.

Descriptors: *Liners, *Clays, *Permeability coefficient, *Field tests, *Design criteria, *Soil mechanics, Fluid mechanics, Membranes, Soil types, Models, Infiltration, Infiltrometers, Hydrologic properties, Thermodynamics, Soil properties.

When soil is to be used as a liner material, accurate soil properties should be obtained by simple, rapid, and reliable methods across a grid or transect sampling area. Field measurements of soil hydrological properties are often time consuming and are being replaced by models of water retention (Brooks and Corey) and the Green and Ampt infiltration equation. The high variability of scale models may be bypassed by measuring hydrological properties at a larger scale. Another attractive approach for evaluating a potential performance of clay liners is the use of scaling theory based on the concepts of similar media. Scaling factors can be obtained from readily available infiltration parameters. In swelling systems, the effect of gravity on flow will be less or nonexistent, and vertical moisture profiles are likely to vary depending on clay thickness and location with respect to the water table. Fluid mechanics and thermodynamics have been used to predict the behavior of swelling soils. Soil structure, aggregate stability, and dispersion may also influence hydraulic conductivity. Hydraulic conductivity is generally evaluated at high gradients to shorten time needed to obtain results. The ring infiltrometer test for infiltration and measurements of macroporosity by the clothier and White infiltrometer are described along with design criteria for determining the hydrologic behavior of clay liners. WATER RESOURCES OF THE RATTLESNAKE BUTTE AREA, A SITE OF POTENTIAL LIGNITE MINING IN WEST-CENTRAL, NORTH DAKOTA,
Geological Survey, Bismarck, ND. Water Resources Div.
W. F. Horak.
Available from OFSS, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 83-4228, 1983. 53 p, 23 fig, 3 tab, 7 ref.

Descriptors: *Aquifers, *Groundwater, *Surface water, *Water chemistry, *Lignite, *Strip mining, Observation wells, Test holes, Belfield, Dickinson, South Heart, *North Dakota.

The D and E lignite beds, the two mineable beds in the lower Sentinel Butte Member (Fort Union Formation), underlies the entire Rattlesnake Butte study area, North Dakota but are unsaturated in much of their area of occurrence. Ground-water flow in both lignite aquifers is largely controlled by topography. Interconnected sand beds form aquifers between the E and D beds (E-D aquifer) and below the D bed (D-HT aquifer). These aquifers underlie the central part of the study area and consist of fine silty sand. Depth to the aquifers is as much as 320 feet. Aquifers also occur in sands of Late Cretaceous and early Tertiary age. Aquifers in the Fox Hills Sandstone (Cretaceous) and lower Tongue River Member (Tertiary) have depths of about 1,700 and 750 feet, respectively. All aquifers yield a sodium bicarbonate or sodium sulfate type water. Mean dissolved-solids concentrations in the four shallowest aquifers ranged from 1,290 to 1,970 milligrams per litter. North Creek and an unnamed tributary of Green River drain most of the study area. North Creek, the main drain, ceases to flow during several months of most years, while the Green River tributary, with a smaller basin area, has sustained base flows of 0.1 to 0.25 cubic foot per second. Mining-induced impacts on the shallow ground-water flow system would be very localized because of the already low water levels and the segmented nature of the flow system in the lignite aquifers. GROUND-WATER HYDROLOGY OF THE SEVIER DESERT, UTAH, WITH RESULTS OF DIGITAL-COMPUTER MODELING,
Geological Survey, Salt Lake City, UT. Water Resources Div.
W. F. Holmes.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. Issued as Utah Department of Natural Resources Technical Publication 79, and USGS Open-File Report 83-0432, 1984. 59 p, 31 fig, 2 tab, 36 ref.

Descriptors: Water resources, *Utah, Great Basin, *Hydrology, Recharge, Storage, Evapotranspiration, *Water quality, *Model studies, *Sevier Desert, *Finite-difference models, Model predictions.

Changes in ground-water withdrawals, water levels, and quality of water occurred in the artesian aquifers of the Sevier Desert, Utah during 1963-81. Ground-water withdrawals increased from an average of 9,500 acre-feet (11.7 cubic hectometers) per year between 1951 and 1963 to an average of 27,500 acre-feet (33.9 cubic hectometers) per year between 1964 and 1981. Most of the increased withdrawal was from the deep artesian aquifer. Water levels declined as much as 19 feet (5.8 meters) in the deep artesian aquifer and as much as 13 feet (4.0 meters) in the shallow artesian aqui

etween 1963 and 1981. The declines probably are e to increased ground-water withdrawals for igation and municipal use. Quality of water in rts of the shallow artesian aquifer is deteriorat-. The deterioration probably is the result of charge of poor quality from the overlying water-le aquifer. A digital-computer model was con-ucted to predict water-level changes resulting om changes in recharge and discharge for 20 ars (1981-2000) at one-half, one, and two times e 1977-79 average rate. The model computer ater-level declines of more than 80 feet (24 eters) in the deep artesian aquifer with withdraw-twice the 1977-79 average, declines of more an 40 feet (12 meters) if withdrawals were equal the 1977-79 average, and declines of more than feet (4.6 meters) if withdrawals were one-half e 1977-79 average. Computer water-level de-nes after 20 years in the shallow artesian aquifer ere more than 50 feet (15 meters) at two times e 1977-79 average rate, more than 15 feet (4.6 eters) at the 1977-79 average, and less than 4 feet 2 meters) at one-half the 1977-79 average. The odel also was used to predict the effects of proximate changes in ground-water withdrawals ated to the Intermountain Power Project. ater-level declines in the deep artesian aquifer of re than 15 feet (4.6 meters), and only small anges in water levels in the shallow artesian uifer after 20 years. These changes are in addi-n to changes computed for 20 years of with-awals at the 1977-79 rate. (USGS)

ELIMINARY STUDY OF THE AQUIFERS THE LOWER MESILLA VALLEY IN XAS AND NEW MEXICO BY MODEL SIM-ATION,
ological Survey, Austin, TX. Water Resources
. Gates, D. E. White, and E. R. Leggat.
ailable from OFSS, USGS, Box 25425 Lake-od, CO 80225. USGS Water-Resources Investi-ions Report 84-4317, 1984. 21 p, 6 fig, 9 ref.

scriptors: *Groundwater, Groundwater basins, undwater movement, Model studies, Hydro-ic models, Transmissivity, Specific yield, Stor-, Well spacing, Aquifers, Aquifer characteris-, *Texas, El Paso, Juarez, Rio Grande, Ground-er modeling.

e aquifers in the lower Mesilla Valley of Texas New Mexico provide water for irrigation, strial use, and municipal supply. The shallow ifer principally is used for irrigation. The lium-depth aquifer and deep aquifer are used by city of El Paso for municipal supply, about ,000 acre-feet per year in 1975. The potential of the medium-depth and deep aquifers for gation, together with a planned increase in ping by the city, is causing concern about the act of this development. A three-dimensional tal model of the aquifers was developed to luate the responses of water levels to various emes of development, with particular emphasis he medium-depth and deep aquifers in and near Canutillo well field. The model simulations cate that if pumpage increases to 10,000 acre-per year from the medium-depth aquifer and 0,000 acre-feet per year from the deep aquifer, elsewhere is constant, then additional lowering vater levels would be as much as 24 feet in the lium-depth aquifer and as much as 52 feet in the aquifer. The water levels would decline ply during the first few months, after which levels would become nearly stable because the age between the aquifers probably is enough to nce the increased pumpage. The model also cated that lining of the channel of the Rio nde would result in an additional lowering of er levels by 10 feet in the medium-depth aqui-nd 8 feet in the deep aquifer. (USGS)

APPRAISAL OF THE SURFICIAL AQUIFERS IN THE POMME DE TERRE AND CHIPPEWA RIVER VALLEYS, WESTERN MINNESOTA,
Geological Survey, St. Paul, MN. Water Resources Div.
W. G. Soukup, D. C. Gillies, and C. F. Myette.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4086, 1984. 63 p, 26 fig, 15 tab, 37 ref.

Descriptors: *Outwash, *Aquifers, *Irrigation wells, *Streamflow depletion, Model studies, *Surface-groundwater relationships, *Minnesota, *Pomme de Terre River, *Chippewa River, Analytical model, Finite-difference models, Transient calibration.

The surficial outwash aquifer along the Pomme de Terre and Chippewa Rivers, Minnesota is as thick as 100 feet and has a maximum transmissivity of 35,000 feet squared per day. An analytical model of a 50-mile reach of the Pomme de Terre River valley indicates that the 43 existing irrigation wells pumping at maximum potential yields could reduce streamflow 77 cubic feet per second which exceeds low base flow of the river. Results from a finite-difference model of the Appleton area indicate that pumping lowered ground-water levels as much as 3 feet from 1973-80 and reduced streamflow 14 cubic feet per second. Simulation of increased irrigation pumping and decreased areal recharge during a three-year drought indicates that water levels may decline 9 feet and streamflow may be reduced 41 cubic feet per second. When results of the analytical and finite-difference models are combined, computed streamflow reductions exceed available base flow by as much as 60 cubic feet per second. Results from a finite-difference model of the Benson area indicate that at maximum hypothetical development, drought conditions and increased irrigation pumping may lower water levels 12 feet and reduce flow in the Chippewa River 30 cubic feet per second, which is less than low base flow. Descriptors: *Groundwater, *Well yield, Fractured rocks, Groundwater use, Saturated fracture zones, Recharge, Lineations, Groundwater discharge, Grass Valley, Nevada County, *California.

This report describes the availability of ground water in the southwestern part of Nevada County, and suggests general guidelines for selecting sites for future ground-water development in the study area. Ground water in this area occurs chiefly in fractures in hard pre-Tertiary metavolcanic and plutonic rocks generally above a depth of 215 feet. Some ground water is found at the contact between alluvium or decomposed granite and the underlying hard rock; little is found in alluvium or colluvium. Mean yield is less than 18 gallons per minute. HYDROGEOLOGY OF A LOW-LEVEL RADIOACTIVE-WASTE DISPOSAL SITE NEAR SHEFFIELD, ILLINOIS,
Geological Survey, Urbana, IL. Water Resources Div.
J. B. Foster, J. R. Erickson, and R. W. Healy.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 83-4125, 1984, 83 p, 48 fig, 7 tab, 23 ref.

Descriptors: *Groundwater, *Glacial soils, *Radioactive wastes, *Tritium migration, Geology, Hydrology, Hydraulic conductivity, Groundwater flow model, Path of pollutants, *Illinois, Waste disposal sites, US Ecology Company, Inc., Sheffield facility.

The Sheffield low-level radioactive-waste facility is located on 20 acres of rolling terrain 3 miles southwest of Sheffield, Illinois. The shallow hydrogeologic system is composed of glacial sediments. Pennsylvania shale and mudstone bedrock isolate the regional aquifers below from the hydrogeologic system in the overlying glacial deposits. Pebbly sand underlies 67 percent of the site. Two ground-water flow paths were identified. The primary path conveys ground water from the site to the east through the pebbly-sand unit; a secondary path conveys ground water to the south and east

through less permeable material. The pebbly-sand unit provides an underdrain that eliminates the risk of water rising into the trenches. Digital computer model results indicate that the pebbly-sand unit controls ground-water movement. Tritium found migrating in ground water in the southeast corner of the site travels approximately 25 feet per year. A group of water samples from wells which contained the highest tritium concentrations had specific conductivities, alkalinities, hardness, and chloride, sulfate, calcium, and magnesium contents higher than normal for local shallow ground water. HYDROLOGY OF AREA 60, NORTHERN GREAT PLAINS AND ROCKY MOUNTAIN COAL PROVINCES, NEW MEXICO, COLORADO, UTAH, AND ARIZONA,
Geological Survey, Albuquerque, NM. Water Resources Div.
F. E. Roybal.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 83-203, 1983. 80 p, 47 fig, 9 tab, 54 ref.

Descriptors: Coal mining, Surface water, Groundwater, *Water quality, *Geohydrology, Land use, Observation wells, Water level, Streamflow variability, Erosion, Sedimentation, *Water pollution sources, *New Mexico, *Colorado, *Utah, *Arizona, *Delores River basin, *San Juan River basin.

An expansion of coal-mining activity is planned for Coal Area 60, which is one of 20 hydrologic reporting areas in the Northern Great Plains and Rocky Mountain Coal Provinces. Coal Area 60 includes approximately 20,000 square miles and is located at the southern end of the Rocky Mountain Coal Province in northwestern New Mexico, southwestern Colorado, southeastern Utah, and northeastern Arizona. Area 60 includes parts of the Dolores and San Juan River basins. Water-quality characteristics are based on data from 67 surface-water stations and 49 ground-water stations. Dissolved-solids concentrations in perennial rivers such as the San Juan River commonly are less than 500 milligrams per liter. Dissolved-solids concentrations of 2,000 milligrams per liter or more are present in the flows of ephemeral channels such as the Chaco River. Calcium and bicarbonate ions are the predominant ions in headwater flows, whereas sodium and sulfate ions become increasingly more dominant in the downstream direction. Concentrations of dissolved iron, manganese, and other trace elements in surface water generally are less than the limits set in drinking-water and mining regulations; however, the total recoverable concentrations from water-sediment mixtures may exceed these limits. Suspended sediment concentrations exceeding 10,000 milligrams per liter are present in the flow of arroyos that drain areas with sparse vegetation. The chemical-quality characteristics of ground water are similar to those of surface water except that the dissolved-solids concentration in ground water from all formations, especially shale deposits, may exceed 3,000 milligrams per liter. Sulfate concentrations are small in the ground water associated with coal deposits. Large concentrations of fluoride are present in ground water from all formations; large concentrations of lead, selenium and nitrate are associated with certain formations. Large alkalinity concentrations are found in the surface waters and ground waters of Area 60. (USGS)

GEOLOGY OF THE SURFICIAL AQUIFER SYSTEM, BROWARD COUNTY, FLORIDA,
Geological Survey, Miami, FL. Water Resources Div.
C. R. Causaras.
Available from OFSS, USGS, Box 25425. Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4068. 1985. 2 pl, 9 fig, 9 ref.

Descriptors: *Geologic formations, *Cross sections, *Hydrology, Carbonate aquifers, Unconfined aquifer, *Forida, Broward County, *Biscayne aquifer.

The geologic framework of the surficial aquifer system, of which the Biscayne aquifer is the major component in Broward County, Florida, is presented in eight geologic cross sections. The cross sections are based on detailed lithologic logs of 27 test wells that were drilled, in the summer of 1981, through the sediments overlying the relatively impermeable units of the Hawthorn Formation, of Miocene age. The cross sections show the aquifer system as a wedge-shaped sequence of Cenozoic sediments. The aquifer thickness gradually decreases from more than 400 feet along the coast to about 160 feet in the west and southwest parts of Broward County. The sediments that comprise the aquifer system range in age from Pliocene to Pleistocene and are assigned to the following stratigraphic units from bottom to top: Tamiami Formation, Caloosahatchee Marl, Fort Thompson Formation, Key Largo Limestone, Anastasia Formation, Miami Oolite, and Pamlico Sand. DELINEATION AND DESCRIPTION OF A ZONE OF HIGHER SECONDARY PERMEABILITY IN THE SURFICIAL AQUIFER OF EASTERN PALM BEACH COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
L. J. Swayze, and W. L. Miller.
Available from OFSS, USGS, Box 25425, D
wood, CO 80225. USGS Water-Resources Inv
gations Report 83-4249, 1984. 39 p, 22 fig, 5 ta
ref.

Descriptors: *Groundwater, Water quality, G
gy, *Florida, *Hydrogeology, Aquifers, *Pe
ability, Saline water intrusion, Palm Beach Co
Aquifer characteristics, *Secondary permeab

The surficial aquifer is the primary source of f
water for the heavily developed coastal are
eastern Palm Beach County, Florida. Well f
are generally located in a discontinuous zon
higher secondary permeability, the northern
extension of the Biscayne aquifer in the sur
aquifer, that extends from the Juno Beach
south to Broward County and varies in width
about 4 to 15 miles. The zone was formed
varying dissolution of aquifer limestone mate
during Pleistocene age changes in sea level,
ranges in depth from about sea level to 220
below sea level. Because of proximity to the A
tic Ocean and saltwater estuaries, the aquife
susceptible to saltwater intrusion. Ground wat
the west of the zone of higher secondary pe
ability is of poor quality. The ground wate
calcium bicarbonate dominant. Dissolved so
calcium carbonate hardness, and chloride
greatest along the saltwater intruded coastline
in the western part of the study area where dil
residual seawater exists. Total organic carbon
creases inland due to infiltration of rainw
through thicker layers of organic soils. Grou
water levels in the surficial aquifer in eastern P
Beach County are strongly influenced by
trolled levels in canals. In March 1981, afte
months of below average rainfall, ground-w
levels ranged from about 2 feet above sea l
along the coast to nearly 21 feet above sea leve
miles inland in the northwest section of the st
area. (USGS)

Descriptors: Aquifers, Groundwater, Surf
water, *Lignite, *Strip mines, Williston, *No
Dakota, Williams County.

The Avoca deposit in the Sentinel Butte mem
of Fort Union Formation consists of four potent
ly strippable lignite beds. Average bed thickness
in descending order, are 5, 5, 9, and 8 feet. In
area between Stony Creek and Crazy Man Coul
the lignite beds are unsaturated, and betwe
Stony Creek and Little Muddy River, only the t
lowest beds are saturated. Aquifers in sandsto
beds in the Fox Hills Sandstone and the Hell Cre
Formation probably would yield as much as
gallons per minute of sodium bicarbonate ty
water. However, the aquifers are from 1,100
1,800 feet below land surface. Individual sand be
in the Tongue River and Sentinel Butte Membe
of the Fort Union Formation are the shallow
aquifers below the minable lignite beds. Prope
constructed wells completed in these sand be
could yield as much as 40 gallons per minute. T
water generally is a sodium bicarbonate type w
dissolved-solids concentrations ranging from abo
500 to 4,200 milligrams per liter. (USGS)

MATHEMATICAL MODEL OF THE TESUQUE AQUIFER SYSTEM NEAR POJOAQUE, NEW MEXICO,
Geological Survey, Lakewood, CO. Water Resources Div.
G. A. Hearne.
Available from Distribution Br., USGS, 604 S. Pickett St., Alexandria, VA 22304. USGS Water-Supply Paper 2205, 1985. 75 p, 81 fig, 17 tab, 55 ref.

Descriptors: *Mathematical models, *Groundwater movement, *New Mexico, Water levels, Withdrawal, Irrigation, Water use, Model studies, Simulation analysis.

A three-dimensional digital model of ground-water flow was constructed to represent the dipping anisotropic beds of the Tesuque aquifer system underlying the Pojoaque River basin and vicinity, New Mexico. Simulations of steady-state conditions and historical ground-water withdrawals were consistent with observed data. The model was used to simulate the response of the aquifer system to an irrigation-development plan in the Pojoaque River basin. Storage is the main source of water; 34.05 cubic feet per second (86 percent of the withdrawal rate) was simulated to be withdrawn from storage after 50 years of withdrawals for irrigation development. The maximum simulated water-level decline was 334 feet, and the net simulated streamflow capture from the Rio Grande and the Santa Cruz, Pojoaque, and Santa Fe Rivers was 5.63 cubic feet per second (14 percent of the withdrawal rate). The sensitivity of the model was tested by varying aquifer characteristics to the limits of the plausible range. Change in hydraulic head in the Pojoaque River basin is most sensitive to hydraulic conductivity. In all simulations, after 50 years of withdrawals, the maximum simulated decline in hydraulic head ranged between 210 and 374 feet, storage in the aquifer system was the source of 80 to 90 percent of the water withdrawn from wells, and streamflow capture from the Rio Grande and its tributaries plus irrigation diversions from the tributaries of the Pojoaque River simulated a decrease in the flow of the Rio Grande of between 17.13 and 21.11 cubic feet per second. PROGRESS REPORT ON BLACK MESA MONITORING PROGRAM-1984,
Geological Survey, Flagstaff, AZ. Water Resources Div.
G. W. Hill.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Open-File Report 85-483, 1985. 24 p, 4 fig, 9 tab, 6 ref.

Descriptors: *Groundwater, *Water level, Water quality, *Aquifers, *Arizona, Black Mesa, *Navajo Indian Reservation, *Hopi Indian Reservation, Monitoring.

The N aquifer is an important source of water in the 5,400 square-mile Black Mesa area on the Navajo and Hopi Indian Reservations. The project is designed to monitor long-term effects on the ground-water resources of the mesa as a result of withdrawals from the aquifer by a strip-mining operation. Withdrawals from the N aquifer by the mine have increased from 95 acre-ft in 1968 to more than 4,000 acre-ft in 1984. Water levels in the confined area of the aquifer have declined as much as 75 feet in some municipal and observation wells within about a 15-mile radius of the mine well field. Part of the drawdown in municipal wells is due to local pumpage. Water levels have not declined in wells tapping the unconfined area of the aquifer. Chemical analysis indicate no significant changes in the quality of water from wells that tap the N aquifer or from springs that discharge from several stratigraphic units, including the N aquifer, since pumping began at the mine. Descriptors: Groundwater, Surface water, *Radioactive waste disposal, *Hydrogeology, *Groundwater movement, Path of pollutants, *Nevada, *California, Nevada test site.

Yucca Mountain, Nevada, is one of several sites under consideration for construction of the first repository for high-level nuclear waste. The climate is arid; few perennial streams are present in the region. Flash floods occasionally occur. The site is underlain by at least 1,800 meters of volcanic tuffs of Tertiary age; limestones and dolomites of Paleozoic age underlie much of the surrounding region, and, together with alluvial deposits, comprise the major aquifers. Yucca Mountain is in the Alkali Flat-Furnace Creek Ranch ground-water subbasin, which is part of the Death Valley ground-water basin. Discharge occurs at Alkali Flat almost entirely by evapotranspiration, and at Furnace Creek Ranch from small springs and seeps. Beneath Yucca Mountain, depth to water ranges from about 460 to 700 meters; the rock under consideration for construction of the repository is in the unsaturated zone. Rate of recharge at Yucca Mountain is small, perhaps much less than 5 millimeters per year. Within the saturated zone, water movement is principally along fractures. The hydraulic gradient is small east (downgradient) of Yucca Mountain, and increases to the north and west. Lack of effective-porosity data presently precludes accurate calculation of flow velocity and travel times. (USGS)

GEOLOGY, HYDROLOGY, AND WATER QUALITY OF THE CAMBRIAN AND ORDOVICIAN SYSTEMS IN NORTHERN ILLINOIS,
Geological Survey, Urbana, IL. Water Resources Div.
A. P. Visocky, M. G. Sherrill, and K. Cartwright.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. Illinois State Water Survey, Illinois State Geological Survey, Cooperative Groundwater Report 10, 1985. 136 p, 45 fig, 6 tab, 123 ref.

Descriptors: *Geologic formations, *Groundwater, *Aquifers, *Confining beds, *Aquifer systems, Bedrock, Pumping, Drawdown, Water Quality, Hydrology, Geology, *Hydrogeology, Cambrian system, Ordovician system, *Illinois, Confined area, Unconfined area.

Cambrian and Ordovician strata provide much of the groundwater supply for approximately 250 municipalities and 150 industries in the northern half of Illinois. The Cambrian and Ordovician aquifers average approximately 1,000 feet in thickness, and are hydraulically interconnected and behave as a single aquifer. Recharge occurs principally by vertical percolation of precipitation in areas where the aquifers are not confined. Additional recharge in heavily pumped areas occurs through leakage across the overlying Maquoketa Confining Unit. The practical sustained yield of the Cambrian and Ordovician aquifers is estimated to be 65 million gallons per day in northeastern Illinois. Pumpage has exceeded this amount since about 1958. The largest withdrawals occur in Cook, DuPage, Kane and Will Counties. Withdrawals have caused water levels to decline as much as 900 feet in parts of these counties. In north-central and northwestern Illinois, development has not exceeded the pratical sustained yield. Groundwater in the recharge area of the Cambrian and Ordovician aquifers is chemically homogeneous and low in dissolved solids. However, significant vertical and areal changes in the chemical character of groundwater occur in the confined area. As water moves away from the recharge area to the east and south, it increases in dissolved solids. (USGS)

A. J. Peck.
IN: Advances in Irrigation, Volume 2, Academic Press, New York. 1983. p 189-221, 7 fig, 1 tab, 90 ref.

Descriptors: *Soil water, *Soil physical properties, *Variability, *Irrigation, *Solute transport, Spatial analysis, Scaling theory, Steady flow, Nonsteady flow, Sampling, Correlation analysis, Mathematical studies, Kriging, Flow, Leaching, Infiltration, Soil porosity, Drainage, Wetting.

Quantitative studies of soil variability and its impact on water and solute transport in fields are in a state of rapid development. However, several implications are apparent. A very large number of samples are needed to reasonably estimate the mean of properties with high spatial variability, such as water and solute drainage rate. Present methods for spatial analysis, which provides a means for characterizing soil variability are limited. A major problem of methods for computing the spatial scale of soil variation is the dependence of the correlogram on the length of a transect through its effect on the variance of sample data. It

is preferable to use the variogram to quantify scales of soil variation. The scaling of soil water properties provides a single parameter for describing soil variations to nonuniform soil imply that evapotranspiration and drainage are almost uniform in areas which do not lose or gain water by surface runoff. A definition of scaling factors through infiltration and drainage experiments is easier and as effective as working from soil water retention and conductivity relationships. Soil variability is a major factor contributing to nonuniform leaching of salts from fields. When the probability density function of solute transport properties has a large variance, a relatively large spatial variation in water application rates appears to have little influence on field-averaged solute concentrations during leaching. At present, an equivalent uniform medium cannot be defined to describe water and solute transport in nonuniform fields using the Richards equation. (Cassar-PTT)

MODEL OF ROOT GROWTH AND WATER UPTAKE ACCOUNTING FOR PHOTOSYNTHESIS, RESPIRATION, TRANSPIRATION, AND SOIL HYDRAULICS,
Auburn Univ., AL. Dept. of Agronomy and Soils.
M. G. Huck, and D. Hillel.
IN: Advances in Irrigation, Volume 2, Academic Press, New York. 1983. p 273-333, 17 fig, 2 tab, 37 ref, 3 append.

Descriptors: *Soil-water-plant relationships, *Irrigation, Model studies, *Root development, Evapotranspiration, Photosynthesis.

A model describing the growth and function of higher herbaceous plants considers several independent processes governed by a set of quantitative relationships involving the transport and transformations of water, carbon, and energy in the soil-plant-atmosphere continuum. This model, a simplification of reality, does not explicitly account for nutrient uptake, soil aeration, soil temperature, soil mechanical resistance to root penetration, or plant physiological processes (photosynthesis, respiration, stomatal closure, translocation, and allocation of assimilates). However, the model in its present state of development can predict plant responses to various sets of circumstances for comparison with observations. Possible uses for the model include root growth and distribution under different soil and climate conditions; assessment of the effects of irrigation strategies on crop response, evaporation, and drainage; and study of the role of genetic or adaptive factors involved in drought tolerance. W86-02132

TECHNIQUES FOR ESTIMATING IRRIGATION WATER REQUIREMENTS,
Wyoming Univ., Laramie. Dept. of Agricultural Engineering.
R. D. Burman, R. H. Cuenca, and A. Weiss.
IN: Advances in Irrigation, Volume 2, Academic Press, New York. 1983. p 335-394, 13 fig, 16 tab, 56 ref.

Descriptors: *Evapotranspiration, *Irrigation, *Soil-water-plant relationships, Computers, Penman equation, Crop coefficients, Root zone, Effective precipitation, Climatic data.

Estimation of irrigation water requirements requires determination of evapotranspiration and other factors. Methods for estimating evapotranspiration are described. These include the grass- versus alfalfa-based reference crop method; the Penman method; non-Penman methods such as Priestly-Taylor, FAO-24, Jensen-Haise, Blaney-Criddle, U.S. Soil Conservation Service TR-21, and Boorenbos-Pruitt. Methods are also given for estimating other factors: crop coefficients, rooting depth, and effective rainfall. Methods for computing evapotranspiration must be calibrated for different climates. The suitability of 16 methods are compared, using lysimeters at 10 locations worldwide. No one method works well in all climates. Commonly, the methods under- or overpredicted evapotranspiration on the order of 100% for climates unlike those in which they had been developed. Data required for four FAO methods (Blaney-Criddle, radiation, Penman, and pan evaporation) are given. Use of microprocessors and data collection instruments improve the accuracy and speed of developing irrigation water requirements. A sample problem is calculated, applying the Penman equation to estimate reference crop evapotranspiration. (Cassar-PTT)

SEDIMENT YIELDS IN EASTERN MONTANA: SUMMARY OF DATA AND PROPOSED TECHNIQUES FOR ESTIMATING SEDIMENT YIELDS FROM SMALL, UNGAGED WATERSHEDS,
Geological Survey, Helena, MT. Water Resources Div.
J. H. Lambing.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water Resources Investigations Report 84-4200, 1984. 45 p, 3 fig, 9 tab, 35 ref.

Descriptors: *Sediment yield, *Basin characteristics, *Multiple regression, Erosion, Ungaged watersheds, Streamflow, Sediment transport, *Eastern Montana, Fort Union coal region, Power River coal region.

Sediment-yield data for 121 sites in eastern Montana have been compiled from results of studies conducted by various Federal, State, and private agencies. Methods used to determine mean annual sediment yields included reservoir sedimentation surveys, suspended-sediment sampling in streams, and estimates of gross erosion and indirect estimation based on physical characteristics of the basin. Multiple-regression equations were developed and evaluated for their adequacy in estimating mean annual sediment yields from small, ungaged watersheds in eastern Montana. Sediment yields determined from reservoir surveys were used as the dependent variable because they were considered the most representative of long-term yields. Independent variables consisted of basin characteristics which could be measured from maps or obtained from published sources. Consequently, equations developed in this study do not require onsite data. Evaluation of equations indicated that the best prediction capability was obtained when reservoir basins were segregated into classes of similar vegetation/soil complex. The predictive capability of regression equations developed for each of three classes of vegetation/soil complex, as indicated by the coefficient of determination (R2), ranged from 0.59 to 0.96. Corresponding standard errors ranged from 95 to 20 percent. The equations are applicable for small drainage basins of 2 square miles or less within the study area. (USGS)

The Green River above gaging station 09315 at Green River, Utah, drains about 44,850 sq miles in Utah, Colorado, and Wyoming. The age annual precipitation near the station was inches. Rocks ranging in age from Precambri Holocene are exposed in the Green River drai basin above Green River, Utah. Shale, silts and mudstone of Tertiary age probably are most easily eroded rocks in the basin, and contribute a large part of the sediment load i Green River. During 1930-82, the U.S. Geolo Survey collected records of fluvial sedimen station 093150000. Based on these records mean annual suspended-sediment load was a 15,630,000 tons, ranging from 1,780,000 during 1934 to 43,400,000 tons during 1937. minimum daily load of 54 tons was on Septe 27, 1956, and the maximum daily load of 2,230 tons was on July 11, 1936. Analysis of the susp ed-sediment records collected from 1930-82 a tion 093150000 indicated that the accuracy o records is fair prior to 1945 and good for remaining period of record. The records after reflect the use of improved sampling equipm (USGS)

HYDRAULIC AND SEDIMENT CHARACTERISTICS AT THE NORTH CHANNEL BRIDGE, JAMAICA BAY, NEW YORK,
Geological Survey, Albany, NY. Water Resources Div.
W. W. Staubitz, and S. W. Wolcott.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 85-4085, 1985. 43 p, 6 fig, 11 tab, 23 ref.

Descriptors: Hydraulics, Tides, *Tidal currents, *Channel scour, Bottom sediments, Suspended sediments, Water quality, *New York, Jamaica Bay, North Channel Bridge, North Channel, Data collections.

Data were collected during the spring of 1984 in the vicinity of North Channel Bridge in Jamaica Bay, New York to define the hydraulic regime and the physical characteristics and chemical quality of bottom sediments. The data were used in a semi-quantitative analysis to predict the effects of bridge replacement and the attendant resuspension of bottom sediments, on the hydraulics and quality of water and bottom sediments. The bay-bottom configuration at the bridge site was defined, and continuous tidal stage and tidal velocity data were collected for about a month. In addition, eight bottom-sediment samples were collected near the bridge and analyzed. Results of the hydraulic analysis show that the proposed bridge should not have any measurable effect on the net water transport at the bridge cross section. The sediment data indicate that bottom sediments are relatively unpolluted in the vicinity of the bridge. Seventy-five percent of the resuspended bottom sediments will probably settle within 186 m of the bridge during an average ebb tide. Metals and nutrients released from the sediments to the water column are expected to be diluted far below detection limits. The extra oxygen demand exerted by the resuspended bottom sediments is also expected to be far less than ambient biochemical oxygen demand of the water column. (USGS)

CRITICAL COMMENT ON THE INTERNATIONAL ATOMIC ENERGY AGENCY REPORT ON THE ADVISORY GROUP MEETING ON STABLE ISOTOPE REFERENCE SAMPLES FOR GEOCHEMICAL AND HYDROLOGICAL INVESTIGATIONS, VIENNA, AUSTRIA, SEPTEMBER 19-21, 1983, BY R. GONFIANTINI,
Geological Survey, Reston, VA. Water Resources Div.
T. B. Coplen, I. Friedman, and J. R. O'Neil.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4136, 1984. 6 p, 1 fig, 2 ref.

Descriptors: Geochemistry, Isotopes, Water quality standards, Oxygen isotopes.

According to U.S. Geological Survey records, a report prepared by R. Gonfiantini summarizing the findings and recommendations of the 1983 Advisory Group Meeting on Stable Isotope Reference Samples for Geochemical and Hydrologic Investigations held in Vienna does not accurately represent the consultants' consensus on three important points. The consultants (1) recommended no value for the C02-H20 oxygen isotope fractionation factor, not the cited value of 1.04115, (2) adopted a value of 1.0309 rather than 1.03086 to relate the PDB and SMOW scales, and (3) adopted a firm 180 value of -2.20% for NBS-19 on the PDB scale rather than agreeing that this would be a tentative value subject to modification when more measurements in selected laboratories are available. HYDROGEOLOGIC RECONNAISSANCE OF STRATIFIED-DRIFT AQUIFERS NEAR SIMSBURY, CONNECTICUT: AVAILABLE DATA AND FUTURE NEEDS,
Geological Survey, Hartford, CT. Water Resources Div.
J. W. Bingham.
Available from OFSS, USGS Box 24525 Lakewood, CO 80225. USGS Water-Resources Information Report 83-4145, 1984. 31 p, 4 fig, 24 ref.

Descriptors: *Glacial aquifers, *Ground-water availability, Ground-water potential, *Aquifer characteristics, Water-resources development, *Connecticut, *Town of Simsbury, Stratified-drift aquifers, Hartford County, Saturated thickness.

Hydrogeologic data from several sources were used to prepare maps showing the extent, saturated thickness, and composition of stratified-drift deposits near Simsbury, Connecticut. This synthesis of available data is intended to guide future ground-water studies by identifying favorable areas for development and additional information useful for resources planning and management. Deposits suitable for ground-water development underlie part of Stratton Brook valley and an area between the Farmington River and the community of Hoskins. Other potentially favorable areas occur east of the Farmington River near Avon, in the upper part of Stratton Brook valley and Bissel Brook valley. Extensive, thick deposits of silt, clay, and sand unsuitable for ground-water development underlie most of the Farmington River valley. In several areas of the town, subsurface data is sparse and the water-yielding characteristics of the stratified drift are unknown. (USGS)

ORIGIN AND NATURE OF SELECTED INORGANIC CONSTITUENTS IN NATURAL WATERS,
University of Southern California, Los Angeles. Environmental Engineering Program.
B. A. Eichenberger, and K. Y. Chen.
IN: Water Analysis, Academic Press, Orlando, FL, 1982, Volume 1: Inorganic Species, Part 1. p 1-54, 1 tab, 255 ref.

Descriptors: *Water analysis, *Trace elements, *Trace metals, *Inorganic compounds, *Chemical reactions, Reviews, Metals, Hydrogen ion concentration, Conductance, Dissolved solids, Water quality, Drinking water, Natural waters, Metal complexes, Hydrolysis.

Inorganic species enter natural waters from a variety of sources such as the weathering of rocks and soils, atmospheric fallout, and anthropogenic inputs. The possible interactions occurring between metallic species and other solution species are described, followed by a discussion of individual metals. These interactions include: hydrolysis reactions, complexation with inorganic ligand, complexation with organic ligands, and conductance and pH effects. The pH and conductivity of the water system can control solubilization or agglomeration and therefore subsequent sedimentation of the metal species. A discussion of the possible hydrolysis products, complex species, and toxicity for 15 metals and three nonmetals in natural-water systems is given. Twelve of the metals under consideration are incorporated in the EPA Primary and Secondary Drinking Water Regulations (As, Ba, Cd, Cr, Cu, Fe, Pb, Mn, Hg, Se, Ag, and Zn). Sb, Be, and Ni, which have also shown toxic properties, are included in the discussion. B, F, and cyanides are the three nonmetals considered. (Geiger-PTT)

REDOX POTENTIAL: ITS MEASUREMENT AND IMPORTANCE IN WATER SYSTEMS,
Maryland Geological Survey, Baltimore.
O. P. Bricker.
IN: Water Analysis, Academic Press, Orlando, FL, 1982, Volume 1: Inorganic Species, Part 1. p 55-83, 11 fig, 2 tab, 101 ref.

Descriptors: *Oxidation-reduction potential, *Chemical reactions, *Water anlaysis, *Trace, elements, *Natural waters, Oxidation, Trace metals, Dissolved solids, Hydrogen ion concentration, Conductance, Potentiometers, Electrodes.

Oxidation and reduction (redox) reactions play an important role in determining the behavior of many elements in the environment. The theoretical framework of redox reactions is given. The redox potential is usually measured electrometrically with an electrode pair consisting of an inert metal electrode coupled with a reference electrode. The electrometers usually employed are the direct reading meter and the null balance meter. The electrodes of the electrometer must be made of a material that is inert to chemical reaction in the system being measured, but electroactive to both the reduced and oxidized species involved. The nobel metals, boron carbide, and graphite are commonly used in electrodes. The hydrogen electrode is the ultimate reference standard of redox potential measurements. The calomel electrode and the silver-silver chloride electrode are also described. The operation of reference electrodes depends upon liquid junction effects. The redox potential is a variable of major importance in characterizing systems containing elements that exhibit more than one oxidation state. When the appropriate thermodynamic data are available, the equilibrium configuration of a redox system may be easily modeled for a given set of conditions. Perhaps the most reliable method currently available for evaluating the redox state of a system is quantitative analysis of the oxidized and reduced species of a component of the system. (Geiger-PTT)

ALKALINITY AND ACIDITY,
McMaster Univ., Hamilton (Ontario). Dept. of Geology.
J. R. Kramer.
IN: Water Analysis, Academic Press, Orlando, FL, 1982, Volume 1: Inorganic Species, Part 1. p 85-135, 7 fig, 5 tab, 20 ref.

Descriptors: *Alkalinity, *Acidity, *Water analysis, *Natural waters, *Chemistry properties, Trace elements, Hydrogen ion concentration, Physiochemical properties, Colloids, Chemical analysis, Chemical reactions.

Alkalinity is a routinely measured parameter for natural waters and wastewaters, whereas acidity is less commonly measured but is involved in analysis of low-pH solutions such as rainfall. Alkalinity and acidity are conservative terms that change only with the volume of the sample. Parameters that are

significant in alkalinity and acidity determinations consist of nutrients, trace metals, organic acids, gases, solids, and colloids. There is often a good relationship between specific conductance and the alkalinity for natural waters when calcium and bicarbonate ions make up the major portion of ions. The monoprotic, diprotic, and carbonate systems are considered along with Gran and modified Gran analysis of titration data, and analysis of mixed ligand systems. Some details of anlaysis of acidity and alkalinity are considered. Methods involving modified Gran analysis are encouraged although fixed-endpoint methods are briefly discussed, but particular attention is given to the use and determination of H-ion concentration rather than activity. The inability to obtain a linear function in a modified Gran analysis is often due to wrong assumptions regarding electrode response and also to the reliance on pH buffer solutions. (Geiger-PTT)

THEORY AND MEASUREMENT OF TURBIDITY AND RESIDUE,
Hach Co., Loveland, CO.
R. D. Vanous, P. E. Larson, and C. C. Hach.
IN: Water Analysis, Academic Press, Orlando, FL, 1982, Volume 1: Inorganic Species, Part 1. 1982, p 163-234, 37 fig, 6 tab, 15 ref.

Descriptors: *Turbidity, *Dissolved solids, *Suspended solids, *Physical properties, *Water analysis, Chemical properties, Wastewater analysis, Water quality, Natural waters, Nephelometers, Opacity, Light penetration.

Any natural water sample that the anslyst comes in contact with will invariably contain residue. The importance of monitoring residue was not fully realized and its applications were not widespread until the late 19th century. The nonspecific analytical techniques of residue analysis and turbidimetry are based largely on the physical parameter of size, with little or no significance attached to their chemical nature. The principles of light scattering that are fundamental to turbidity measurements are described, with special emphasis on Raleigh scattering and Mie scattering. The effects of sample and instrument parameters on turbidity measurement are examined. Early turbidimetric methods utilized the visual devices of Jackson, Hellige, Duboscq, and Parr. Modern nephelometric instruments rely on detectors such as the photomultiplier tube, vacuum photodiode, the silicon photodiode, and the CdS photoconductor. Responses of commercially available nephelometers that affect the outcome of turbidity measurements are compared. Process instruments used to continually monitor turbidity are described. A comparison of various specifications of nephelometric instruments is given. The calibration and standardization of nephelometric instruments are considered along with the potential of future nephelometric developments. The procedures used for the determination of residue (suspended and dissolved solids) are reviewed. (Geiger-PTT)

CHEMICAL REACTIONS INFLUENCING SALINITY INCREASE OF SOIL AND GROUNDWATERS IN THE GREAT BASIN, WESTERN UNITED STATES,
Nevada Univ. System, Reno. Desert Research Inst.
B. Bohm, and R. L. Jacobson.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 525-535, 4 fig, 20 ref.

Descriptors: *Groundwater, *Salinity, *Water pollution sources, Calcium, Magnesium, Sodium, Potassium, Silica, Chloride, Alkalinity.

Groundwater chemistry in the semi-arid western Great Basin is mostly controlled by common processes of rock dissolution and formation of secondary minerals. The major cations and silica are provided from dissolution of silicate minerals. Levels of Ca, Mg, SO4 and alkalinity are mostly controlled by incongruent silicate reactions. Chloride is derived from traces in rocks and only minimally from cyclic salts. It increases gradually along a flow path and due to the high solubility of its salts, its levels are not restricted. The acidity required for the advance of rock dissolution is probably mostly provided by CO2 derived from geothermal processes, and to a lesser degree from biological activity in soils and perhaps locally from the oxidation of sulfide minerals. The Kootenai Formation in the Judith Basin, Montana, and the Lance Formation and Fox Hills Sandstone in the Powder River Basin, Wyoming, constitute two important sandstone aquifer systems in the Northern Great Plains region. Calculation of the saturation states of aquifer minerals suggests several carbonate, silicate, and aluminosilicate phases, which could control ground-water chemistry. Mass transfer modeling indicates that the observed behavior of major and minor dissolved species in both systems can satisfactorily be explained by equilibration with calcite and dolomite. Specific processes controlling the geochemistry of these systems are probably the incongruent dissolution of dolomite to form calcite driven by the dissolution of CO2. Plausible CO2 sources include organic carbon oxidation and lignite coalification. Aluminosilicates influence major element chemistry primarily as substrates for cation exchange. Measured variations in dissolved carbonate isotopic composition compare favorably with carbon isotopic evolution, calculated by assuming de-dolomitization. Ground-water flow rates, calculated by adjusting measured carbon-14 activities for carbonate mass transfer, are comparable to values calculated from hydrologic aquifer tests and potentiometric data. These carbon-14 flow rates average .6 meters per year for the Second Cat Creek aquifer of the Kootenai Formation, and 1.3 meters per year for the Lance-Fox Hills aquifer. (USGS)

Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Open-File Report 84-074, 1984. 129 p, 4 fig, 4 tab, 42 ref.

Descriptors: Rivers, *Estuaries, Sediments, Pore water, Alkalinity, Sulfide, Sulfate, Phosphate, Carbon, Ammonium, Silica, Iron, Manganese, Chloride, Sodium, Potassium, Calcium, Magnesium, Porosity, Nitrogen, Phosphorus, Cores, Tidal Potomac River, *Potomac Estuary, Sediment sampling, Core processing, *Geochemical data, Water quality, pH, Eh.

The chemical composition of bottom sediments and their associated pore waters from the tidal Potomac River and Estuary was studied from May 1978 through June 1980. Pore waters were routinely analyzed for pH, Eh, alkalinity, and concentrations of sulfide, sulfate, phosphate, carbon, ammonium, silica, iron, manganese, chloride, sodium, potassium, calcium, and magnesium. Porosity, weight loss on ignition, and carbon, nitrogen, and phosphorus contents were determined for the solid sediments. The range of salinity and chemical composition encountered in the estuary frequently necessitated modifications of standard methods of analysis. Therefore, the methods used, their modifications, and their limitations are presented in some detail. The appendix lists the data obtained from six sampling periods. (USGS)

ESTUARY AS A FILTER,
Proceedings of the Seventh Biennial International Estuarine Research Conference, Virginia Beach, Virginia, October 23-26, 1983. Academic Press, Orlando, FL. 1984. Edited by Victor S. Kennedy. 511 p.

Descriptors: *Estuaries, *Filtration, *Particulate matter, *Fate of pollutants, Sediments, Sedimentation, Water circulation, Management, Aquatic life.

Estuaries and coastal areas act as filters between rivers and oceans by trapping significant quantities of sediments and associated pollutants. This filter aspect is emphasized in a collection of papers concerning physical processes, geological processes, chemical-geochemical processes, biological processes, and management implications. The physical shape, mixing, circulation, characteristics, and stage of evolution of the estuary strongly influence its filtering capacity. The Chesapeake Bay and fjords such as Puget Sound are particularly effective filters for particulate matter. Chemical and geochemical processes are illustrated in case studies of nutrients and other substances in northern San Francisco Bay and in the Delaware Estuary. Biological processes involving surface foam, phytoplankton, aquatic plants, and bacteria are shown to affect nutrient and sediment transport in several estuaries. Management strategies are given for reduced freshwater inflow, sedimentation in the Mississippi Delta, pollution in the Chesapeake Bay, and the rehabilitation of water quality in the Thames Estuary. (Cassar-PTT)

ESTUARY AS A FILTER: AN INTRODUCTION,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
J. R. Schubel, and V. S. Kennedy.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 1-11, 10 ref.

Descriptors: *Estuaries, *Filtration, *Particulate matter, *Sedimentation, Suspended sediments, Sediments, Water circulation, Mixing, Rivers, Saline water, Tidal effects, Wind waves, Dissolved solids, Turbidity, Colloids, Nutrients, Organic carbon, Productivity, Aquatic life, *Fate of pollutants, Geochemistry, Management, Sediment transport.

The filter action of estuaries modifies the suspended matter and chemical regime as well as physical inputs such as currents, wind, and tides. This action has both negative effects (dissolved oxygen depletion) and positive effects (rapid recycling of nutrients and organic matter). Estuary circulation ranges from the river-dominated, highly stratified type to the thoroughly mixed, sectionally homogeneous type. The most effective filtration, where productivity is highest, occurs near the upstream limit of sea salt penetration and near the estuary mouth. The turbidity maxima are usually in the null zone, where the upstream flow of the lower layer dissipates. Geochemical removal of dissolved and colloidal material is affected by mixing, gravitational circulation, and alternate deposition and resuspension of bottom sediment by tidal scour and wind waves. Biological and biochemical filtration is a result of filter-feeding activity and biological fixation of dissolved materials into particulate form. Submerged macrophytes remove both dissolved and suspended particulates from the water. An understanding of the filtering capacities of estuaries should be incorporated into management programs. TURBULENCE AND MIXING IN ESTUARIES,
Liverpool Univ. (England). Dept. of Oceanography.
K. F. Bowden.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 15-26, 2 fig, 19 ref.

Descriptors: *Estuaries, *Water circulation, *Mixing, *Turbulence, Currents, Water currents, Filtration, Currents, Model studies, Advection, Diffusion, Dispersion, Tidal effects, Turbidity, Rivers, Sediment transport, Saline water.

Mixing and dispersion in an estuary result from a combination of advective and diffusive processes and are closely related to patterns of circulation. The intensity and scale of turbulence depend largely on the stability of the density distribution and so affect directly the vertical fluxes of momentum and matter. Indirectly, the state of turbulence also influences the longitudinal and transverse mixing. In setting up models to predict changes in estuarine conditions arising from natural external causes or human intervention, most attention in the past has been given to longitudinal fluxes across planes perpendicular to the axis of an estuary. The apparent simplicity of one-dimensional treatments, often used for this purpose, conceals the importance of contributions from physical processes in the vertical and transverse directions. It is likely that two- and three-dimensional models will be more widely used in the future, but their successful employment calls for a better understanding of the physical processes which are to be simulated. VERTICAL VARIATIONS IN RESIDUAL CURRENT RESPONSE TO METEOROLOGICAL FORCING IN THE MID-CHESAPEAKE BAY,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
D. W. Pritchard, and M. E. C. Vieira.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 27-65, 13 fig, 4 tab, 11 ref. 0CN8208363A01.

Descriptors: *Estuaries, *Filtration, *Water currents, *Wind pressure, Chesapeake Bay, Model studies, Currents, Tidal effects, Rivers, Atmospheric pressure.

Records of the nontidal current velocity obtained from current meters deployed for 20 days in two cross sections in Chesapeake Bay were used with an interpolation scheme to produce a vertical profile of the laterally-averaged longitudinal velocity component of one meter depth intervals at each section, at 3-hour intervals over the 15-day truncated record. Various statistical procedures were used to relate variations in the residual current, at each depth, to wind variations. Surface layers down to about 8 m responded directly to wind with little time lag. A slope of the water surface was also set up by the wind, with a consequent barotropic pressure force directly opposite to the wind. The current near the bottom responded first to this pressure force, flowing opposite to the wind with a phase lag of about 8 hours. This counter response proceeded up the water column, such that in the intermediate layers just below the pycnocline the negative response to the wind had a phase lag of about 20 hours. A diagnostic analytical model, based upon a Fourier transform of the linearized equations of motion, was exercised for a four-layered simulation of the vertical response of the currents to inputs of the observed fluctuations in wind and surface slope. The major features of the time variations in the residual currents in the four layers were reproduced by the model. (Author)

TRANSPORT VARIABILITY IN A FJORD,
National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
G. A. Cannon, D. E. Bretschneider, and J. R. Holbrook.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 67-78, 5 fig, 5 ref.

Descriptors: *Estuaries, *Filtration, *Fjords, *Water circulation, *Fate of pollutants, Bottom water, Mixing, Tidal effects, Dissolved solids, Suspended sediments, Particulate matter, Water circulation, *Puget Sound, *Washington, Saline water, Sediments, Rivers.

Bottom water in fjord-like Puget Sound is renewed several times a year, usually at the largest flood tides through Admiralty Inlet and at the smallest neap tides. The controlling mechanism appears to be tidal and mixing processes at the entrance sill. Although the average bottom water replacement time is about two weeks, complete renewal does not occur every two weeks. The inflowing bottom water entrains some of the seaward flowing upper water at the landward side of the sill. This acts as a filter to prevent some dissolved and particulate matter with their associated contaminants from leaving the system. (Cassar-PTT)

ESTUARY AS A FILTER FOR FINE-GRAINED SUSPENDED SEDIMENT,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
J. R. Schubel, and H. H. Carter.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 81-105, 3 fig, 2 tab, 53 ref.

Descriptors: *Estuaries, *Filtration, *Particulate matter, *Sedimentation, Suspended sediments, Sediments, Mixing, Tidal effects, Currents, Water currents, Sediment transport, Model studies, Saline water, Fate of pollutants, Stratification, Chesapeake Bay, Rivers, Turbidity, Potomac River, Wind effects.

Estuaries function as filters for the signals they receive from the land and the sea. The nontidal residual circulation, tidal mixing, and estuarine geometry determine the efficiency of this filter for suspended sediment. Tidal currents provide energy for mixing saltwater from the ocean with freshwater from the river. The resulting salinity distribution drives that part of the nontidal circulation caused by density differences, which in turn influences the salinity patterns and resulting density gradients. This feedback between salinity redistribution and gravitational circulation places a constraint (filter) on the range of variations in flow and salt concentration in the estuary. The nontidal circulation also controls the distribution and transportation of suspended sediment, and the deposition of fine particles with the estuary. The distributions of salt and fine suspended matter control the behavior of many nonconservative constituents such as nutrients, radionuclides and some metals, their modes of occurrence and transport, and their reservoirs of accumulation. The result of these processes is that the estuary modifies significantly the strength and the form of the signals it receives from land and sea. Alteration of an estuary's gravitational circulation pattern by changing its freshwater input or its geometry modifies its filtering efficiency. In general, as an estuary changes from being highly stratified toward being well-mixed, its filtering efficiency for land-derived constituents first increases to a maximum (in the partially-mixed region) and then decreases. A simple kinematic model is used to demonstrate the relationship between estuarine type and filtering efficiency for Chesapeake Bay. (Author)

ESTUARY AS A SEDIMENT TRAP: ALTERNATE APPROACHES TO ESTIMATING ITS FILTERING EFFICIENCY,
Delaware Univ., Newark. Coll. of Marine Studies.
R. B. Biggs, and B. A. Howell.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 107-129, 2 fig, 4 tab, 61 ref. X-003256-01.

Descriptors: *Estuaries, *Filtration, *Sedimentation, *Particulate matter, Capacity/inflow ratio, Model studies, Aquatic life, Zooplankton, Oysters, Shellfish, Suspended sediments, Sediments, Delaware Bay, Bathymetry, Sediment cores, Sediment transport, Rivers, Saline water.

The sediment trapping efficiency of estuaries for particulate matter was reviewed using several methods of estimating trapping efficiency: box models, historical changes in bathymetric data, geochronological data, and the capacity-inflow ratio (C/I). Most open water estuaries (those which have not yet evolved into deltaic systems) showed 90-100% sediment trapping efficiency. The C/I was computed for several estuaries using the mean low water volume to minimize tidal variations and the precipitation times watershed area instead of actual inflow. An exponential curve was devised to use the C/I to predict the percent sediment trapped. A >99% sediment trapping efficiency was equivalent to a C/I of about 2, about 75% t 0.05 C/I, and 30% to 0.006 C/I. A conceptual model was developed to show the source and intensity of areal depositional processes. Biologically mediated sedimentation was shown to be a major factor in sedimentation. For example, the zooplankton, oysters, and mussels in Delaware Bay fix about 400 billion kg/year of sediment. This is 200 times the annual sediment input from the rivers (1.4 billion kg/year). (Cassar-PTT)

RECENT SEDIMENTATION RATES IN CHESAPEAKE BAY,
Dartmouth Coll., Hanover, NH. Dept. of Earth Sciences.
C. B. Officer, D. R. Lynch, G. H. Setlock, and G. R. Helz.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p.131-157, 4 fig, 2 tab, 27 ref.

Descriptors: *Estuaries, *Sediment transport, *Filtration, *Sedimentation rates, *Chesapeake Bay, Tracer studies, Susquehanna River, Rivers, Saline water.

Nonlinear parameter estimation techniques were applied to obtain optimum values and confidence intervals for mass sedimentation rates in Chesapeake Bay from Pb210, Cs137 and Pu239, 240 geochemical tracer profiles. The results show high sedimentation rates of around 0.3-1.2 g/sq cm/year for the upper bay, modest sedimentation rates of 0.1-0.3 g/sq cm/yr for the middle bay, and modest to high sedimentation rates of 0.1-0.8 g/sq cm/yr for the lower bay. The principal source for the upper bay is the Susquehanna River discharge and that for the lower bay is the ocean and lower bay environment. In terms of total sediment budget the results are in agreement with published eivdence that episodic sedimentation events are an important feature of the bay system. (Author)

ROLE OF FLOCCULATION IN THE FILTERING OF PARTICULATE MATTER IN ESTUARIES,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia).
K. Kranck.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 159-175, 6 fig, 44 ref.

Descriptors: *Estuaries, *Filtration, *Particulate matter, *Flocculation, *Sedimentation, Suspended sediments, Sediments, Rivers, Saline water, Particle size, Sediment transport, Settling velocity, Organic matter.

The structuring of suspended particulate matter in estuaries into flocculated settling entities is described and discussed. A hierarchy of three particle distribution types is described: in situ distributions contain abundant large low density fragile aggregates (macro-flocs) with high settling rates, the formation of which is promoted by low turbulence and high particulate concentrations. During periods of high currents in nature and during shipboard and laboratory sample handling, these macro-flocs break up into more stable distributions of smaller flocs which are the basic building blocks of the larger units. Laboratory oxidation of organic matter and disaggregation of aggregates allow the size analysis of individual single mineral grain distributions for purposes of direct comparison between bottom and suspended sediment spectra. The constituent grain-size distribution of the inorganic component of a floc replicates the grain
of the suspension as a whole. The diverse grain
and chemical nature of the organic matter m
its flocculation kinetics more complicated.
laboratory experiments have indicated the
ence of organic-inorganic proportions optimu
flocculation. This is substantiated by ash-loss
from three estuaries with different relative i
of organic and inorganic matter. The partic
matter in each was dominated by similar org
inorganic proportions (65%-75% organic m
by volume) indicating that the componen
excess of this value had been preferentially ex
ed from the estuary. Settling of suspended
ment as macro-flocs and near bottom break-up
resuspension of floc fragments control the
dynamic equilibrium between particle trapping
particle flushing in estuaries. (Author)

sotopes, Sediments, Suspended sediments, Mix
Organic matter, Saline water, Bottom sedim
Sediments, Rivers, Radon, Aquatic life, Ben
fauna.

Naturally occurring radionuclides of the uran
and thorium decay series are useful in study
estuarine geochemical processes ranging from
removal of reactive nuclides from the w
column to the mobilization and transport of ch
cal species in the sediment column. Although
nium isotopes generally show conservative bel
ior during estuarine mixing, removal from solu
can occur at low salinities or in estuaries hig
dissolved organic matter. Uranium in estua
sediments also displays a diagenetic chemi
linked to oxidation-reduction. In contrast to u
um, radium isotopes are released during estua
mixing. Mechanisms of release include desorp
from suspended sediments and the mobilizatio
radium from bottom sediments. The latter is d
onstrated by measurements of Ra226 and Ra22
sediment pore waters. The thorium isoto
Th234 and Th228, produced by decay of solu
parents U238 and Ra228, are good analogs
chemical species which interact strongly with
ticles in the estuary. Both have been used to
mate removal times of thorium from solution
particles. The distribution of Th234 and Th22
sediments is governed primarily by particle mi
by the benthic fauna, and both isotopes serve
chronometers to determine mixing rates. Pb
and its daughter Po210 also serve as tracers
reactive nuclides. Both are removed rapidly
bottom sediments. Although Pb210 is a lon
lived tracer than Th234 or Th228, its depth dis
bution in estuarine sediments is also affected
bioturbation. Successful reconstruction of sedim
chronology in the estuary thus requires the ap
cation of several tracers with different half-li
and independent information on the sedim
budget of the area. (Author)

Estuarine processes can be effective in modifying filtering) distributions of dissolved inorganic orms of carbon, silicon, nitrogen, and phosphorus n northern San Francisco Bay. During winter, igh inflow from the Sacramento-San Joaquin iver system supplied these nutrients to the estuary t rates that exceeded potential rates of estuary upply and removal processes. During spring and ummer, when inflow rates were lower, the estu- ry was an effective filter of the river inflow signal ecause rates of estuarine processes were high elative to river and other supply rates. At lower nflow rates, the river apparently influenced estua- ne hydrodynamic feeatures that controlled rates f phytoplankton nutrient removal. Largest biolog- al removal effects were localized in San Pablo ay during spring and Suisun Bay during summer, nd they were generally more pronounced in shal- w water areas of the bays. In San Pablo Bay, ffects of biological removal appeared soon after ver inflow decreased from high winter rates, but ersisted for only a short time. During the follow- g summer months dissolved nitrogen and dis- lved phosphorus distributions in San Pablo Bay dicated that estuarine sources contributed to igher concentrations of these nutrients. escriptors: *Estuaries, *Fate of pollutants, *Fil- ations, *Nutrients, Phytoplankton, Metals, Heavy etals, Delaware Estuary, Geochemistry, Nutri- nts, Organic matter, Phosphates, Humic acids, rticulate matter, Dissolved solids, Rivers, Saline ater, Iron, Phosphates, Ammonium compounds, rea, Silicates, Nickel, Copper.

he geochemical and the biochemical processes hich alter concentrations of soluble nutrients, rganic matter, and trace metals were studied in e Delaware Estuary using property-salinity plots. eochemical filtration occurred primarily in the w salinity upper estuary, where particulate con- ntrations were highest because of flocculation d resuspension of bottom sediments. Biochemical tration occurred primarily in the low salinity per property-salinity plots. Geochemical filtra- n occurred primarily in the low salinity upper tuary, where particulate concentrations were ghest because of flocculation and resuspension of ttom sediments. Biochemical filtration occurred edominantly in the lower estuary, where biologi- l productivity was highest. Geochemical filtra- n was studied with organic matter, iron, and osphate. Dissolved organic matter and humic id concentrations decreased with increasing sa- ity; amino acids generally increased with in- easing salinity. Iron and phosphate concentra- ns decreased with increasing salinity. However, e steady-state lower limit was higher for iron (30 M) than for phosphate (1 nM). This was attrib- ed to the phosphorus buffer effect. Geochemical moval was most apparent during winter. Bio- emical filtration was studied with nutrients and ce metals. In spring concentrations of ammoni- , phosphate, silicate and urea decreased to arly zero at a salinity of about 15. Phytoplankton tivity was highest in the region of 10-22 salinity. ckel and copper showed little filtration, despite ir potential for bioreactivity. Cadmium and sophate concentrations illustrated a combined geochemical filter, with geochemical exchange minant at lower salinities and biochemical activi- dominant at higher salinities. TUARINE TOTAL SYSTEM METABOLISM ND ORGANIC EXCHANGE CALCULATED FROM NUTRIENT RATIOS: AN EXAMPLE FROM NARRAGANSETT BAY,
Rhode Island Univ., Narragansett. Graduate School of Oceanography.
S. W. Nixon, and M. E. Q. Pilson.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 261-290, 9 fig, 2 tab, 50 ref.

Descriptors: *Estuaries, *Filtration, *Organic matter, *Nutrients, *Narragansett Bay, *Rhode Island, Nitrogen, Phosphorus, Denitrification, Sedimentation, Mixing, Phytoplankton, Productivity, Metabolism, Saline water.

The system metabolism of Narragansett Bay, Rhode Island, was calculated from the annual nutrient input, the ratio of the annual time and volume-weighted mean concentrations of dissolved inorganic nitrogen and dissolved inorganic phosphorus, the annual rate of denitrification, and data on the chemical composition of the plankton. Results showed that the system is autotrophic, with net production exceeding consumption by about 80 g C per sq m per year. The amount or organic matter exported from the bay is 70-75 g C per sq m per year, equivalent to 22-24% of the phytoplankton production. Estimated accumulation in the sediments is about 6 g C per sq m per year; estimated removal by fisheries is about 1 g C per sq m per year. (Cassar-PTT)

Descriptors: *Estuaries, *Fate of pollutants, *Filtration, *Nitrogen, Wastewater disposal, Hudson River Estuary, Phytoplankton, Productivity, Dissolved oxygen, Oxygen, Saline water.

The fate of sewage-derived nitrogen was studied in the Hudson River Estuary. Net export of nitrogen was negligible during March-October. During this period sewage-nitrogen accounted for 54% (March-May) to 121% (June-October) of new production. During the remainder of the year most new nitrogen was exported to adjacent coastal water with little uptake by the plume. Estimated increases in new production as a result of sewage-nitrogen loading were 77 million kg C during March-May and 94 million kg C during June-October. This was a 30% increase in phytoplankton production over the predischarge levels of 578 million kg C per year. During summer, when the phytoplankton production was highest, nitrogen was exported as plankton biomass or as fecal material. The increased phytoplankton production in response to sewage-nitrogen had little effect (about 30%) on dissolved oxygen levels because over 80% of phytoplankton production is metabolized within the plume before reaching the bottom waters. ESTUARY EXTENDED - A RECIPIENT-SYSTEM STUDY OF ESTUARINE OUTWELLING IN GEORGIA,
Georgia Univ., Sapelo Island. Marine Inst.
C. S. Hopkinson, and F. A. Hoffman.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 313-330, 1 fig, 5 tab, 36 ref.

Descriptors: *Estuaries, *Filtration, *Marshes, *Organic carbon, Georgia, Rivers, Saline water, Organic matter, Productivity, Sedimentation, Respiration, Aquatic life, Nearshore processes, Salt marshes.

Organic carbon budgets are presented for the marsh, estuarine water bodies and the inner portion of the nearshore region of Georgia. Budgets were determined by balancing external inputs and outputs from rivers and the mid-shelf against measurements of community production, metabolism and internal organic matter storage. On the marsh, primary production exceeds sedimentation and respiration by a factor of 2.6. The aquatic system is distinctly heterotrophic, with the primary production to community respiration ratio being 0.63:1. The current best estimate is that the autotrophic marsh-estuarine system has 947 g C per sq m potentially available for export. The nearshore system requires an input of 210 g C per sq m per year in addition to primary production to sustain its high rate of community production. Allochthonous organic inputs from rivers constitute 12% of total inputs to the marsh/estuarine/nearshore interface system. Roughly 50% of carbon inputs to the interface system are unaccounted for. About 10% of net primary production of the marsh must be exported to sustain heterotrophic levels in the estuarine aquatic system and the nearshore. The nearshore region is a component of a coupled system and is strongly dependent on the adjacent marsh/estuary and river for a portion of its organic matter. As such, the nearshore can be considered as a functional extension of the estuary into the ocean. The estuary is a filter in the sense that materials received at the land-sea interface will be processed, transformed and exchanged within the marsh/estuary and the nearshore zones. (Author)

SURFACE FOAM CHEMISTRY AND PRODUCTIVITY IN THE DUCKABUSH RIVER ESTUARY, PUGET SOUND, WASHINGTON,
Washington Univ., Seattle. Coll. of Ocean and Fishery Sciences.
R. C. Wissmar, and C. A. Simenstad.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 331-348, 3 fig, 5 tab, 42 ref. R/F-37.

Descriptors: *Estuaries, *Filtration, *Organic matter, Foaming, Nitrogen, Chlorophyll, Adenosine triphosphate, bacteria, Sediments, Duckabush River, Hood Canal, Puget Sound, Washington, Productivity, Neritic environment, Algae, Eelgrass, Phytoplankton.

Chemical and biotic constituentsof surface foam were compared in estuarine and neritic waters of Puget Sound, Washington. The role of surface foam formation as a major filtering medium in an estuary was indicated by entrainment and concentration of constituents in foam several times higher than that of subsurface and neritic waters. Stable carbon isotopic ratios and organic solute fractions (hydrophobic and hydrophilic) indicated that organic matter in foams originated from dissolved organic carbon compounds released from seagrasses and benthic algae. Concentrations of particulate oranic carbon and nitrogen, chlorophyll a, adenosine triphosphate, and bacteria counts showed enrichment in foams due to entrained sediment particles, algae, and bacteria. Inorganic nutrient concentrations, primary production and respiration rates of estuarine foam were also several-fold greater than neritic waters. The high levels of organic and inorganic chemical constituents, and metabolic rates of the microbial community indicate that surface foams are important interfaces for cycling of nutrients, formation of detrital matter, and production of microbial forage for consumers. MICROBIOLOGICAL CHANGES OCCURRING AT THE FRESHWATER-SEAWATER INTERFACE OF THE NEUSE RIVER ESTUARY, NORTH CAROLINA,
East Carolina Univ., Greenville, NC. Dept. of Biology.
R. R. Christian, D. W. Stanley, and D. A. Daniel.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 349-365, 2 fig, 3 tab, 32 ref. NA83AA-D-0012.

Descriptors: *Estuaries, *Filtration, *Bacteria, *Saline-freshwater interfaces, *Neuse River Estuary, *North Carolina, Nitrates, Phosphates, Phytoplankton, Productivity, Chlorophyll, Nitrogen.

The hypothesis that mass mortality of freshwater phytoplankton at the freshwater-saltwater interface causes rapid biogeochemical changes was

tested. Physical, chemical, and microbiological variables were studied in the Neuse River Estuary, North Carolina. Nitrate nitrogen, orthophosphate, and number of phytoplankton taxa all decreased significantly going downriver across the freshwater-seawater interface, while bacterial density and productivity rose sharply. Parameters which did not change significantly were phytoplankton density, chlorophyll a, ammonia nitrogen, and light absorption coefficient. In laboratory studies, increasing salt concentration from zero to 4 ppt produced slightly lower bacterial density and slightly higher bacterial productivity. In the same studies the following parameters were unaffected by the change from freshwater to saline water: primary productivity, chlorophyll concentration, number of phytoplankton taxa, ammonium-N uptake, and nitrate-N uptake. No evidence was found to confirm the hypothesis that salt at the interface affects the microbial community. (Cassar-PTT)

Descriptors: *Estuaries, *Filtration, *Aquatic plants, *Sediments, Submerged plants, *Organic matter, Suspended sediments, Sediments, *Chesapeake Bay, Potamogeton perfoliatus, Ruppia maritima, Phytoplankton, Turbidity, Fish, Aquatic animals, Vegetation effects, Waterfowl, Nitrogen, Phosphorus, Nutrients, Oxygen demand, Productivity, Decomposition.

Physical, chemical and biological influences of submersed vascular plants (dominated by Potamogeton perfoliatus and Ruppia maritima) on their surrounding environment are summarized for portions of Upper Chesapeake Bay. Rates of accretion of organic matter in these ecosystems were high owing to the combined effects of vascular plant and associated algal production and the trapping of particulate organics of phytoplanktonic origin. Time-series observations of seston along transects traversing vegetated bottoms indicated significantly less turbid water over the plant beds, due both to increased deposition and to decreased resuspension of fine-grain sediments. Submersed plants provided a preferred habitat for many animal populations, and abundance of fishes (predominantly juveniles) was significantly greater in these plant beds than in adjacent unvegetated areas. Recent declines in several species of migrating waterfowl which feed directly on plant material were highly correlated with contemporaneous decreases in plant distribution. Rapid uptake of dissolved inorganic nitrogen and phosphorus was demonstrated for these communities, with subsequent incorporation into plant material via both growth and facultative increases in percent N and P composition. Upon senescence and death, submersed vascular plants contributed 33% to the organic C budget, while acting as a seasonal sink for 210% and 7% of the total sediment and nitrogen inputs, respectively, to the estuary. SEAGRASS FILTER: PURIFICATION OF ESTUARINE AND COASTAL WATERS,
New Hampshire Univ., Durham. Jackson Estuarine Lab.
F. T. Short, and C. A. Short.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 395-413, 5 fig, 1 tab, 46 ref.

Descriptors: *Estuaries, *Filtration, *Sedimetation, *Aquatic plants, *Nutrient removal, Particulate matter, Seagrass, Vegetation effects, Silt, Clays, Organic matter, *Indian River, *Florida, Suspended sediments, Sediments, Nitrogen, Phosphates, Saline water.

Sediment removal and nutrient removal were studied in tanks planted with seagrass. Light penetration to specified depth of the tank increased more rapidly with time in seagrass tanks than in uplanted tanks. Halodule wrightii had a greater sediment trapping effect than Syringodium filiforme. Terrestrial organic silt was more readily settled than the other forms of ammonium chloride and sodium phosphate. The rate of phosphate removal was similar in seagrass and nonvegetated tanks (from 2 to 1 micromoles in three hours). Ammonium concentrations were reduced from 10 to 1 micromoles in seagrass tanks within 1.5 hours; from 10 to 6 micromoles in the control tank. Results were extrapolated to field conditions in Indian River Lagoon, Florida. Nitrogen removal in that seagrass community was calculated to be 3890 metric tons of N annually, 1860 tons of this during May-July. This nitrogen removal represents 11% of the nutrient load to the Indian River. However, excessive loading of nutrients or suspended material is detrimental to the seagrass community, promoting loss of the vegetated beds and their filtering mechanism. (Cassar-PTT)

BIOLOGICAL AND PHYSICAL FILTERING IN ARID-REGION ESTUARIES: SEASONALITY, EXTREME EVENTS, AND EFFECTS OF WATERSHED MODIFICATION,
San Diego State Univ., CA. Dept. of Biology.
J. B. Zedler, and C. P. Onuf.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 415-432, 5 fig, 2 tab, 22 ref. R/CZ-33c & R/CZ-51.

Descriptors: *Estuaries, *Filtration, *Sedimentation, Watershed, Enviromental effects, Suspended sediments, Sediments, Saline water, Semiarid lands, Tijuana Estuary, Mugu Lagoon, Colorado Lagoon, *California, Floods, Construction, Aquatic habitats, Habitats, Storms, Seasonal variation, Tidal effects, Nutrients, Channels, Marshes, Salt marshes, Invertebrates.

The filtering functions occurring in the arid region estuaries of southern California were reviewed using data from three tidally flushed systems: Tijuana Estuary, Mugu Lagoon, and Colorado Lagoon. Three hypotheses were developed. (1) The biological and physical filters differ significantly in wet and dry seasons. During the wet season plants take up nutrients, animals consume organic carbon, and sediments are deposited in channels. During the dry season no nutrients are input from the watershed. Organisms continue to filter materials from the water. The filtering function is one of nutrient uptake and recycling rather than tapping of imported particulate organic matter. (2) Extreme events such as floods substantially alter estuarine structure and fuctioning. In channels, sedimentation and salinity reduction can eliminate both plant and animal communities. In salt marshes reduced soil salinity and possibly increased nutrient levels produce increased vascular plant growth and establishment of cordgrass. (3) The combination of extreme events with hunman disturbance in the watershed has the potential for long-term consequences in the estuaries. For example, accelerated erosion from construction increases sedimentation, reducing the water depth and eliminating fish and eelgrass beds in favor of a subtidal habitat. A reservoir drawdown, prolonging the wet season, can eliminate the halophyte community. (Cassar-PTT)

ENVIRONMENTAL CHARACTERIZATION CHESAPEAKE BAY AND A FRAMEWO FOR ACTION,
Environmental Protection Agency, Annap MD. Chesapeake Bay Program.
V. K. Tippie.
IN: The Estuary as a Filter, Academic Press, lando, FL. 1984. p 467-487, 7 fig, 2 tab, 4

Descriptors: *Estuaries, *Water pollution sou *Fate of pollutants, *Filtration, Metals, Org compounds, Water pollution control, Water ity, Management, *Chesapeake bay, Aquatic Shellfish, Fish, Aquatic animals, Aquatic pl Algae, Oysters, Submerged plants, Sediments, trients, Nitrogen, Phosphorus, Dissolved oxy Oxygen.

Data compiled and analyzed during the E Chesapeake bay Program show how the filte action responsible for the estuary's high produ ity also traps pollutants. The bay's ecology gradually changed as follows: blue-green blooms have increased in frequency; subme aquatic vegetation has declined dramatically, ticularly in the upper bay and western shore t taries; freshwater-spawning fish have decli while marine-spawning fish have increased; oyster spat set has decreased significantly as crab harvests have increased. Nutrient levels high in the upper bay and tributaries, modera the eastern shore area, and normal in the lo bay. The amount of water in the main part o bay which has low or no dissolved oxygen increased 15-fold between 1950 and 1980. concentrations of toxic organic compounds a bottom sediments of the main bay near indus facilities, near river mouths, and in areas of m mum turbidity. Metal concentrations are sig cantly higher than background levels in m areas; the Patapsco and Elizabeth Rivers b most highly contaminated. To reverse the de of this ecosystem, inputs of nutrients and t materials must be controlled. Nutrient loadings be reduced by implementing agricultural ru control, urban runoff control, and point so control of industrial and wastewater treatm plant discharges. Metal loadings from point nonpoint sources are already being reduced the aid of the metal contamination index, the to ity index, and effluent/sediment testing pr dures. (Cassar-PTT)

This paper presents the pretreatment and desalting systems at Yuma Desalting Plant at Yuma, Arizona. This discussion of processes includes sedimentation, partial lime softening, filtration, scale inhibitors, and reverse osmosis desalting. Other plant features are office, maintenance areas, computer control, energy recovery, and improving performance of treatment by use of Test Train. The key feature of the desalting plant is the reverse osmosis desalting equipment, with a capacity of 22.4 million-gallons-per day. The present status of constructin including anticipated start-up and completion dates, and an update of capital, operation, and maintenance costs, is also presented. (Halterman-PTT)

ROOFTOP RAINWATER CATCHMENT SYSTEMS FOR DRINKING WATER SUPPLY,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
J. J. Schiller.
IN: Water Supply and Sanitation in Developing Countries, Ann Arbor Science, Ann Arbor, MI, 1982. p 85-100, 13 fig, 9 ref.

Descriptors: *Water supply, *Drinking water, Water conveyance, *Water storage, *Storage tanks, Potable water, Water supply development, Water tanks, Rain, Design criteria, Developing countries, Cisterns, Water demands, Computer models.

In developing countries where the fetching of water is time consuming, rooftop rainwater catchment systems (RWCS) can be a valuable asset. Rainwater catchments are a form of renewable energy technology, using solar energy, which evaporates surface water, both purifying and elevating it. Components of the RWCS are: a catchment device, a conduit system, and a storage tank. In designing such systems the components must be of adequate size and strength to provide the optimum amount of potable water at the most economical cost. A reasonable water demand will have to be selected for design considerations. The time variation of rainfall (RF) is important in designing a RWCS, because the storage tank must be designed to trap the excess rainfall for use in dry periods. Planned rationing can greatly alter the reliability of a system. The first step in designing a RWCS is to determine whether RWCS' are feasible in a given area. To correctly design a RWCS, it is necessary to take into account the variability in the particular RF pattern. Computer modeling with historical RF data is described. Another approach is to apply statistical methods to the design of RWCS systems. Several devices have been used to divert the dirt that accumulates on rooftops and is present in the first runoff of rainwater. The RWCS tank should be cleaned annually. (Geiger-PTT)

IRRIGATION WITH SALINE GROUNDWATER AS A STRATEGY FOR SALINITY CONTROL IN THE SHEPPARTON REGION OF NORTHERN VICTORIA,
Victoria Dept. of Agriculture, Tatura (Australia). Irrigation Research Inst.
R. A. Wildes.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 225-264, 2 tab, 15 ref.

Descriptors: *Salinity, *Saline water, *Water quality control, Groundwater, Irrigation, Irrigation effects, Irrigation practices, Environmental effects, Economic aspects, Agricultural hydrology, Agriculture.

A strategy for salinity control based on private groundwater pumping and the direct, on-farm use of the water for irrigation is described. The major advantage of the on-farm approach to salinity control are that saline drainage flows to the Murray River are minimized while agricultural productivity is improved through the increased availability of irrigation water. The specific benefits include matching irrigation water salinity to suit particular crops, soils, and management methods; maximizing the productive use of groundwater, thus minimizing the amount of salt input to the Murray River; farmer-owned and operated pumps cost less than state-owned pumps; on-farm methods potentially apply to the whole area of the irrigated lands; and greater flexibility of irrigation management including the opportunity to irrigate during winter. (Halterman-PTT)

LIVING WITH SALINITY: AN EVALUATION OF TWO POLICY MEASURES WITHIN A REGIONAL FRAMEWORK.
Hebrew Univ. of Jerusalem (Israel). Dept. of Agricultural Economics.
D. Yaron, and A Ratner.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston, 1984. p 441-454, 1 fig, 4 tab, 15 ref.

Descriptors: *Salinity, *Saline water, Legal aspects, Jurisdiction, Water rights, Water use, Impaired water use.

Two analyses of policy measures aimed at compensating for, or reducing, salinity-induced losses in agriculture are described. The extent of income losses due to salinity depends on: the mix of crops, their sensitivity and income potential; the share of value added in gross output value; and the degree of the farm's adaptation to salinity. With regard to the latter, distinction must be made between: currently practiced crop mix and irrigation technology; crop mix adapted to salinity and currently practiced irrigation technology; and both crop mix and irrigation technology adapted to salinity. The first policy discussed is compensation for increased water salinity, which would become critical for a region when water rights are firmly practiced, and water quality deteriorates. The second policy discussed pertains to the determination of the optimal water quantity-salinity mix for a region and regional co-operation. This issue becomes important when a region can be supplied with more water, but at the cost of increased salinity. Various applications of these policies are discussed and several mathematical treatments are illustrated. (Halterman-PTT)

IRRIGATION AS A SOLUTION TO SALINITY PROBLEMS OF RIVER SYSTEMS,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
G. R. Dutt, D. A. Pennington, and F. Turner.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 465-472, 8 tab, 8 ref.

Descriptors: *Salinity, *Saline water, *Irrigation, Irrigation engineering, Irrigation operation, Irrigation practices, Irrigation-return flow, Water use, Impaired water use.

Saline waters diverted from river systems to maintain water quality usually can be used for the production of salt tolerant crops. Irrigation by saline waters has been shown to be economically feasible in Arizona. The establishment of saline irrigation projects with their accompanying drainage systems and brine disposal facilities can economically use most waters being diverted from river systems. Field data corroborating these conclusions are provided for cotton, barley, sorghum and sugar beets. (Halterman-PTT)

USE OF SALINE WASTE WATER FROM ELECTRICAL POWER PLANTS FOR IRRIGATION,
Utah State Univ., Logan. Dept. of Soil Science and Biometeorology.
R. J. Hanks, R. F. Nielson, R. L. Cartee, and L. S. Willardson.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 473-482, 8 fig, 1 tab, 4 ref.

Descriptors: *Salinity, *Saline water, Irrigation, Irrigation engineering, Irrigation operation, Irrigation practices, Water use, Impaired water use.

Water is generally re-cycled in the evaporation-cooling system of power plants until the salinity of the water reaches a high level, at which time it is disposed of as waste water. The possible disposal of saline waste water from power plants by irrigation of crops is discussed, and is shown to be an economically sound disposal method. The long-term effects of salt and specific ions on the soil and crops are relatively unknown. Five years of experience at Huntington, Utah shows a stability in production for forage and grain crops but a continuing production decrease on root crops. Work will continue, and specific ion effects will be evaluated, to determine their importance for long-term management. (Halterman-PTT)

AQUATRAIN PIPELINE SYSTEM,
Bureau of Reclamation, Denver, CO. Office of Saline Water Transport and Use.
M. J. Clinton, and I. E. McKeever.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 483-492, 1 fig.

Descriptors: *Salinity, *Saline water, Colorado River, Water use, Impaired water use, Salvaged water, Conveyance structures, Pipelines, Resource development, Hydraulic engineering.

The AQUATRAIN project, a proposed pipeline system to help control Colorado River salinity, and economically transport coal to markets, is discussed. The primary goals are: to collect saline water in the Colorado River basin, transport it to points of most beneficial use, and dispose of it in the most cost effective manner; and to provide an economically competitive method of moving coal and other commodities from source points to markets, using a part of the savings in commodity transport costs to pay for the salinity control function. Sources and markets, pipeline corridor selection, program status and schedule, costs, and public involvement in the AQUATRAIN Process are discussed. (Halterman-PTT)
W86-02307

SALT GRADIENT SOLAR PONDS.
Department of Energy, Washington, DC.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 493-502, 5 fig,

1 tab.

Descriptors: *Salinity, *Saline water, *Electric power production, *Solar energy, Water use, Impaired water use, Resource development, Brine disposal.

Various aspects of the possible use of impounded brackish water for a solar power generation facility are discussed. Highly brackish water which would normally flow into the Wichita River, from a variety of sources, would instead be impounded into a solar pond. The solar pond is a device for trapping and storing solar thermal energy. The proposed salt gradient solar pond achieves this by means of a salt concentration gradient, increasing from low salinity at the surface to high salinity a meter or two below the surface. Hence deeper waters are heavier than waters above them, impeding upward movement of warmed water. Thus, the principal mechanism of heat loss in ordinary ponds is impeded. In this manner, temperatures can reach the boiling point of saline water. Coupling the pond with an organic Rankine-cycle engine will produce electricity. The feasibility is discussed in detail. (Halterman-PTT)
W86-02308

REUSING SALINE DRAINAGE WATERS FOR IRRIGATION: A STRATEGY TO REDUCE SALT LOADING OF RIVERS,
Agricultural Research Service, Riverside, CA. Salinity Lab.
J. D. Rhoades.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston, 1984. p 455-464.

Descriptors: *Salinity, *Saline water, *Irrigation, Irrigation engineering, Irrigation operation, Irrigation practices, Irrigation-return flow, Water use, Impaired water use.

Several strategies for coping with increasing levels of salinity in river systems resulting from irrigation are discussed. Emphasis is on irrigation with saline drainage water, and cycling crop types. The process works by intercepting drainage returns before they flow back into the river, and using them for irrigation. When the water is of such poor quality (high salinity) that it is no longer usable, it is pumped into evaporation ponds. Water is conserved and salt loading is minimized by this process. The efficiency of this strategy is maximized when salt sensitive crops irrigated with river water, are rotated with salt tolerant crops which are then irrigated with reused irrigation water with higher salinity. (Halterman-PTT)

3F. Conservation In Agriculture

ADVANCES IN IRRIGATION,
Volume 2, Academic Press, New York, 1983. Edited by Daniel Hillel. 429 p.

Descriptors: *Water conservation, *Irrigation, *Soil-water-plant relationships, *Evapotranspiration, Model studies, Agriculture, Crop yield, Water stress.

This serial publication updates developments in irrigation science and practice. Irrigation scheduling with emphasis on timing criteria is reviewed. Energy consumption by irrigation, methods for conserving energy in irrigation and energy sources for future development are described. A review of crop-water production functions reveals the complexity of the interactions underlying the productive relationship between crops and irrigation water. In Australia irrigation is limited by political and economic factors. The plant-environment model, Cupid, is used to study the complete water budget of a crop. Soil variability has profound effects on irrigation efficiency. However, present methods have many problems, including the need for a large number of samples. Models based on the response functions of crops can be used to develop irrigation schedules. The dynamic crop response model, incorporated into a dynamic programming model, obtains the optimal irrigation schedule for given economic conditions. A model describing the growth and function of plants has several possible uses. Methods for determining evapotranspiration are reviewed. Remote sensing techniques can be applied to estimating crop stress and evapotranspiration. (Cassar-PTT)
W86-02123

IRRIGATION SCHEDULING: APPLIED TIMING CRITERIA,
North Dakota State Univ., Fargo. Dept. of Agricultural Engineering.
E. C. Stegman.
IN: Advances in Irrigation, Volume 2, Academic Press, New York. 1983. p 1-30, 17 fig, 1 tab, 90 ref.

Descriptors: *Water conservation, *Irrigation efficiency, Crop yield, Economic aspects, Hydrologic budget, Soil water, Evapotranspiration, Water potentials, Air temperature, Temperture.

Irrigation scheduling concepts were reviewed with emphasis on timing criteria. Yield-evapotranspiration relationships show an upper-bound region for a given set of production inputs. Upper-bound yields can be attained with a variety of irrigation schedules. Maximum economic returns are usually obtained when yields are in the maximal seasonal yield region. Water balance methods of irrigation scheduling are usable with computer technology. High efficiencies (near maximum yield with minimal annual seasonal applied depth application) can be attained with a variety of methods for estimating evapotranspiration. Allowable root zone soil water depletion criteria are the most widely used methods for irrigation timing. Some improvement has been seen in several plant-based methods: evapotranspiration deficit, leaf water potential, foliage-air temperature difference. (Cassar-PTT)

ENERGY UTILIZATION AND MANAGEMENT IN IRRIGATION,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
J. R. Gilley.
IN: Advances in Irrigation, Volume 2, Academic Press, New York. 1983. p 31-59, 8 fig, 4 tab, 45 ref.

Descriptors: *Water conservation, *Irrigation efficiency, *Energy, *Fuels, Sprinkler irrigation, Surface irrigation, Pumps, Fertilizers.

An estimated 0.32 exajoules of energy was used to pump irrigation water in the U.S. in 1980. Natural gas accounts for 40.6%; electricity, 25.2% diesel, 21.7%; propane, 9.5%; and gasoline, 3%. Some methods of reducing energy use in irrigation include reduction in pumping volume (by improved irrigation efficiency or reduced net application); reduction in pumping head (by reduced-pressure sprinkler systems, replacement of sprinkler systems by surface systems, substitution of surface water for groundwater, reduction of friction in pipelines, or improved well design); improvement in pumping plant performance; less operation during peak electrical demand hours; improved fertilizer practices; and reduction in tillage. Energy saving practices are described for surface systems and for center-pivot sprinkler systems. Although sufficient conventional fuels are available, prices are expected to increase. Alcohol and wind power will be among the first renewable energy sources to become widely used, followed by biomass and solar systems. (Cassar-PTT)
W86-02125

CROP-WATER PRODUCTION FUNCTIONS,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
H. J. Vaux, and W. O. Pruitt.
IN: Advances in Irrigation, Volume 2, Academic Press, New York. 1983. p 61-97, 2 fig, 1 tab, 88 ref.

Descriptors: *Water conservation, *Irrigation efficiency, *Economic aspects, Water stress, Water use, Prices, Crop yield, Soil water, Evapotranspiration.

A review of crop-water production functions revealed the complexity of the interactions which underlie the productive relationship between and water in irrigated agriculture. The mecha which govern whether water is limiting or well understood, but the response of plants timing and level of moisture stressing in less u stood. Evidence indicates that the relationsh tween evapotranspiration and yield is linea that the relationship between yield and ap water is curvilinear. The factors which gove relationship between evapotranspiration an plied water are not well understood. Thus, i tors have little incentive to save water by pe ting water to limit plant moisture stress-yield tionship is unclear. The economic literature cates that water would be used more efficien agriculture if it were priced according to its scarcity value. However, risk, timing, and stage dependence must be considered before ture stressing is widely practiced. (Cassar-
W86-02126

IRRIGATION IN AUSTRALIA: DEVE MENT AND PROSPECTS,
Commonwealth Scientific and Industrial Res Organization, Griffith (Australia). Centre for gation Research.
R. C. Smith, W. K. Mason, W. S. Meyer, and D. Barrs.
IN: Advances in Irrigation, Volume 2, Acad Press, New York. 1983. p 99-153, 9 fig, 11 tab ref.

Descriptors: *Water conservation, *Irriga *Crop yield, *Soil, Clays, Australia, Past Water resources, Irrigation efficiency, Water cation, Salinity, Saline soils, Nutrients, Root Soil management, Surface irrigation.

Irrigation in Australia has been limited by pol and economic factors. Most of the irrigati used for pastures. When crops are irrigated, results are often obtained because of poorly pe able soil. Water is limited, highly-valuable, low-priced. Water allocation rules make it dif to shift the water from areas of lower product to areasof higher productivity. The Murray- ling basin contains 90% of the continent's irrig land; development here is nearly complete. main water resource potential for irrigation ex sion is in northern Australia, where crop yield low and market opportunities scarce. Soil thro out much of the continent is unsuitable for ir tion. Heavy clays with significant levels of changeable sodium and magnesium lead to p lems of low permeability. This soil can be man with minimal tillage, incorporation of crop dues, better irrigation scheduling, and nut management. (Cassar-PTT)

APPLICATION OF A PLANT-ENVIRONM MODEL TO PROBLEMS IN IRRIGATION,
Nebraska Univ., Lincoln. Dept. of Agronomy.
J. M. Norman, and G. Campbell.
IN: Advances in Irrigation, Volume 2, Acade Press, New York. 1983. p 155-188, 16 fig, 7 tab ref. NA 80AA-H-00087.

Descriptors: *Soil-water plant relationships, * gation, Model studies, Evapotranspiration, Eva ration, Cupid model, Canopy, Interception, drologic budget, Water loss.

The plant-environment model Cupid is useful studying the complete water budget of a c Several implications were developed. About fourth of the evapotranspiration in Nebraska-t climate is evaporation. Interception evaporatio greatest in canopies with small leaves such wheat or prairie grass, where it might reach 10 for a single event. Using air temperatures measure of plant temperature will introduce er in management because air temperature differs several degrees from those of the canopy and surface. For a wet soil surface and given atm pheric vapor pressure and temperature, evapo tion from the soil can vary from negligible to m than 50% of the evapotranspiration. Cupid reas ably predicts the canopy water balance com nents; however, the interception evaporation smaller than measurements. The model does

nsider several important factors in sufficient tail–the influence of surface residues on energy d water balances or the effects of residues, sur- e crusting, and surface slope in infiltration and noff. (Cassar-PTT)

SALINITY CONTROL THROUGH WATER CONSERVATION IN THE UPPER COLORADO RIVER BASIN,
Utah State Univ., Logan. Coll. of Engineering.
A. B. Bishop, D. R. Franklin, and R. Narayanan.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 243-252, 2 fig, 1 tab, 3 ref.

Descriptors: *Saline water, *Salinity, *Water quality control, *Economic aspects, Model studies, Colorado River, Water conservation, Conservation, Water costs, Costs, Water demand, Dissolved solids.

The economic feasibility of public and private water conservation measures that could be employed in response to salinity control and increased water prices are discussed. Specific issues that are addressed include the total cost to the economy of the public sector investments in water conservation and other measures which reduce salinity; the water conservation measures in private agricultural and energy sectors which are economically efficient; and the benefits and costs of various government-sponsored water-saving techniques. Model simulations indicate that public investments in measures only for the sake of water conservation are not economically efficient since the marginal value of water is less than the cost of conservation. When factors that increase salinity levels are taken into consideration, however, the value of water conserved is greater than the cost of various conservation programs, because the water saved is used for decreasing the salinity levels downstream through greater dilution. CASE STUDY OF A MAJOR AGRICULTURAL CONTROL PROGRAM - THE GRAND VALLEY EXPERIENCE,
Soil Conservation Service, Denver, CO.
M. E. Hess.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 285-294, 3 tab, 7 ref.

Descriptors: *Salinity, *Saline water, Groundwater, Irrigation, Irrigation effects, Irrigation practices, Environmental effects, Economic aspects, Agricultural hydrology, Agriculture, Colorado River.

Methodologies to control salinity in the Colorado River in the vicinity of the Grand Valley include installing structural measures to reduce seepage from unlined earthen irrigation ditches; improving irrigation water management practices to reduce deep percolation from field irrigation and to enhance uniformity of irrigation applications; and implementing a monitoring and evaluation program to assess the effectiveness of salinity control measures. The structural measures (pipelines, gated pipes, ditch lining and land leveling) have reduced salt loads by an estimated 17,500 metric tons per year. Key elements of the monitoring and evaluation program include measuring surface inflow and runoff to determine water infiltration into the ground, collecting local climatological data to evaluate crop evapotranspiration requirements (to help determine deep percolation rates), and using soil moisture sensors to assess uniformity of irrigation. The use of these data for salt loading computation under improved management practices is discussed. (Halterman-PTT)

SALINITY CONTROL AND DRAINAGE IN NORTHERN VICTORIA (AUSTRALIA),
Victoria State Rivers and Water Supply Commission, Armadale (Australia).
K. O. Collett, and G. C. Earl.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 315-323, 1 fig.

Descriptors: *Salinity, *Saline water, *Water quality control, Groundwater, Irrigation, Irrigation effects, Irrigation practices, Environmental effects, Economic aspects, Agriculture, Agricultural hydrology, *Australia.

Following the irrigation-related rise of the water table and increased salinity level of the ground water, a drainage strategy was developed to prevent waterlogging and control salinity. Pumping saline groundwater and draining it into the River Murray, the initial action taken, caused reduced water quality in the River Murray. On-farm measures, such as recycling, which have been demonstrated to be a partial solution to the problem, could improve the situation. Wide scale use of on-farm alternatives have not yet been put into practice. The main points concerning the current developments in salinity mitigation are: strategies based on public scale schemes may not always be able to be justified in economic terms; integrating efforts at the on-farm level with public-scale action offers possibilities for achieving salinity control and drainage objectives within economic and other constraints; and finally, there is a willingness to modify current irrigation practices in order to achieve these objectives. A preliminary investigation of the effects of reservoir storage and canal diversion on the flow of the

Group 4A—Control Of Water On The Surface

Yakima River at Union Gap, Washington indicates that those effects are measurable and substantial--on the average causing a reduction of roughly one-quarter from the unregulated flow. Preliminary computations of the unregulated flow of the Yakima River at Parker (near Union Gap) for the 1978 water year using the U.S. Bureau of Reclamation's SSARR model indicate, however, that the computed flow figures contain inaccuracies. Further investigation of the model indicates that the inaccuracies can be substantially reduced by data checking and by using additional discharge records to improve the estimation of local inflows. Descriptors: *Discharge coefficients, *Control-gate ratings, *Iowa, Stage-discharge relations, Tainter gate, Roller gate, Current-meter measurements, Tainter-gate opening, *Mississippi River, *Lock and Dam 11.

The water level of the navigation pools on the Mississippi River are maintained by the operation of tainter and roller gates at locks and dams. Discharge ratings for the gates on Lock and Dam 11, Dubuque, Iowa, were developed from current-meter discharge measurements made in the forebays. Methodology is given to accurately compute the vertical gate openings of the tainter gates. Discharge coeffients, in equations that express discharge as a function of tailwater depth, headwater depth, and vertical height of gate opening, were determined for conditions of submerged-orifice and free-weir flow. A comparison of the rating discharges to the theoretical rating discharges is given for submerged orifice flow for the tainter and roller gates. (USGS)

SIMULATED EFFECTS OF AN ARTIFICIAL-RECHARGE EXPERIMENT NEAR PROCTOR, LOGAN COUNTY, COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
A. W. Burns.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4010, 1984. 17 p, 6 fig, 3 tab, 6 ref.

Descriptors: *Artificial recharge, *Surface-groundwater relationships, Logan County, *Colorado, *Simulation analysis.

An artificial-recharge experiment was conducted near Proctor, Colorado in which a computed 620 acre-feet were pumped from a well during a 4-month period. A computed 420 acre-feet were delivered at the potential reservoir site, and the remaining 200 acre-feet leaked from the pipeline. No pond was created due to the high rates of infiltration. Water levels in the nearest well (about 0.1 mile from the recharge site) rose almost 25 feet. Computer simulations indicate that this 4-month pumping-recharge experiment would cause stream depletions from the nearby South Platte River for the first 16 months, thereafter, stream accretions due to the recharge would exceed stream depletions due to pumpage. If the experiment was conducted annually, the simulations indicate that stream depletions would occur for 6 months of each year and stream acretions for the remaining 6 months once the system reached an equilibrium condition. To reach the cyclic equilibrium condition would take at least 7 years. (USGS)

SUMMARY OF RESULTS OF AN INVEST TION TO DEFINE THE GEOHYDROL AND SIMULATE THE EFFECTS OF LA GROUNDWATER WITHDRAWALS ON MISSISSIPPI RIVER ALLUVIAL AQUIFE NORTHWESTERN MISSISSIPPI,
Geological Survey, Jackson, MS. Water Reso Div.
D. M. Sumner, and B. E. Wasson.
Available from OFSS, USGS, Box 25425, wood, CO 80225. USGS Water-Resources In gations Report 84-4343, 1984. 17 p, 10 fig, 1

Descriptors: *Groundwater availability, *I tion effects, *Model studies, *Simulation ana *Alluvial aquifers, Groundwater recharge, P tiometric level, *Mississippi, *Mississippi al plain, Yazoo Basin, Mississippi River alluvial fer.

The 7,000 square-mile Mississippi River al plain in north-western Mississippi (the Del underlain by the prolific Mississippi River al aquifer that currently (1983) yields about Mgal/d of water to irrigation wells. Comm about 20 feet of clay underlying the Delta surface is underlain by about 80 to 180 feet of and gravel that forms the aquifer. The Missi River is in good hydraulic connection wit alluvial aquifer. Generally smaller streams ar likely to have good hydraulic connection wit aquifer. Direct vertical recharge to the al aquifer is small. A two-dimensional finite-d ence computer model of the alluvial aquifer constructed, calibrated, and verified using levels observed for five dates within the p April 1981 to September 1983. The model s that the aquifer had a net loss in storage of a 360 Mgal/d for the 2-year period April 19 April 1983, when pumpage was about 1,100 M d. The net inflows from the sources of rech were: Mississippi River, 390 Mgal/d; rech along east edge of the Delta, 170 Mgal/d; str within the Delta, 81 Mgal/d; and areal rech from infiltration, 180 Mgal/d. The effects of s al levels of pumpage by wells were projecte years into the future. In 2003, the result of co ued pumpage at the 1,100 Mgal/d pumping would be lowered ground-water levels of than 20 feet in a large area in the central part o Delta, and ground-water levels would contin decline. HYDROLOGY OF PRAIRIE DOG CR VALLEY, NORTON DAM TO STATE L NORTH-CENTRAL KANSAS,
Geological Survey, Garden City, KS. Water sources Div.
L. E. Stullken.
Available from OFSS, USGS, Box 25425, L wood, CO 80225. USGS Water-Resources Inv gations Report 84-4162, 1984. 49 p, 10 fig, 1 ta ref.

Descriptors: Hydrology, Steady-state mo *Groundwater flow, Recharge, Discharge, F flow, *Hydrogeology, Water levels, *Water y *Surface-groundwater relationships, *Prairie Creek Valley, *Kansas.

Development of water resources has been a m factor in the economy of Prairie Dog Creek Va in north-central Kansas. Releases from No Reservoir to the Almena Irrigation District a aged 6,900 acre-feet per year during 1967-76. number of irrigation wells increased from 4 to during 1947-78. Ground water in the valle derived mostly from the alluvial aquifer. The fects of irrigation on the aquifer are indicated water-level changes. The water in storage creased from 130,000 to 136,000 acre-feet du 1947-78 due to recharge from surface-water ir

ion. A steady-state model of the aquifer prior to rrigation (1947) indicated that most recharge was rom precipitation (88 percent) and most discharge as to streams (54 percent) and reparian transpira-on (26 percent). Although aquifer storage in-reased in this area, storage generally decreased in ther areas of western Kansas. (USGS)

round-water bodies impounded by volcanic dikes nstitute important reservoirs of high-quality ter. These reservoirs have high hydraulic heads d are mostly isolated from saline water. The st important and productive of these reservoirs cur in the Koolau Range, where the top of the pounded water ranges to an altitude of at least 00 feet. The storage above sea level of these ervoirs has been roughly estimated at 550 bil-n gallons. In the Waianae Range the top of the pounded water ranges to an altitude of at least 00 feet and the estimated storage above sea level about 100 billion gallons. Water-development nels have, by breaching dike controls, reduced rage by a least 50 billion gallons in the Koolau ge and by about 5 1/2 billion gallons in the ianae Range. A significant part of the storage s reduced by each tunnel can be restored by kheading the dike or dikes which impounded most water, as indicated by flow records gath-d during tunneling. (USGS)

House.
lable from OFSS, USGS Box 25425 Lake-l, CO 80225. USGS Water-Resources Investi-ns Report 84-4051, 1984. 17 p, 9 fig, 5 tab, 7

riptors: *Urbanization, Storm runoff, Urban sheds, Ponds, Watershed models, Water qual-ydrologic budget.

A digital hydrologic model was used to simulate the effects of future residential development on pond inflow volumes and resulting water levels of three ponds in Middleton, Wisconsin. The model computed the daily water budget and the resulting water level for each pond. The results of the model calibration are presented in the report, along with the existing watershed hydrologic conditions and runoff volumes for the 1982 study period. Data was collected during 1982 to claibrate the model; the data included pond stage, ground-water levels, precipitation and other meteorological characteristics. In addition, water-quality samples were collected at each pond to characterize the water quality. Simulation of pond levels with the 1982 rainfall and fully developed watersheds did not result in stages greater than those observed in 1982. Simulation of pond levels with rainfall having a 20-year recurrence interval (1978) and hypothetical, fully developed watersheds resulted in maximum pond stages above those observed in 1982. Peak stage of Tiedeman's Pond would increase by 2.77 feet, Stricker's Pond by 3.91 feet, and Esser's Pond by 1.44 feet. Simulation of pond levels with an estimated 100-year rainfall and hyopthetical, fully developed watersheds would result in peak stage increases of 5.30, 5.32, and 1.97 feet above the peak 1982 observed stages for Tiedeman's, Stricker's, and Esser's Ponds, respectively. ANALYSIS OF SALT YIELDS ASSOCIATED WITH THE CONSTRUCTION AND OPERATION OF PARIETTE DRAW WILDLIFE AREA, UTAH,
Bureau of Land Management, Denver, CO.
W. L. Jackson, and S. Hudson.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 549-558, 5 fig, 1 tab, 3 ref.

Descriptors: *Salinity, *Saline water, Water pollution, Utah, Dissolved solids, Construction.

A fifty-percent increase in annual salt yield has been recorded at the downstream (7300) gage at Pariette Draw following the beginning of construction of the Pariette Draw Wildlife Management Area. This increase occurred during a period when there was a much smaller (11%) increase in salt yield at the upstream (7200) station. However, analysis of water discharge data and station salt-loading functions (Q vs. TDS) indicate that 94% of the increase in annual salt yield at the downstream station is due to the increase in mean monthly flow, following the beginning of construction of the wildlife management area, and 6% of the increase is due to a small though statistically significant (alpha=0.05) change in the salt loading function (Q vs. TDS) at the downstream station. It is hypothesized that increased inflows from Castle Peak tributary caused downstream flows during the post-construction period to increase proportionally more than flows entering the area upstream. Because the 6-year period of record is short for this type of analysis, any results or conclusions must be considered tentative. (Author)

SECONDARY SALINIZATION OF WATER RESOURCES IN SOUTHERN AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Groundwater Research.
M. L. Sharma, and D. R. Williamson.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 571-580, 3 fig, 2 tab, 22 ref.

Descriptors: *Salinity, *Saline water, *Water pollution sources, *Land management effects, Groundwater, Evapotranspiration, Groundwater recharge, Groundwater movement, Australia.

Secondary salinization is a problem of considerable magnitude in southern Australia. The situation arises as a consequence of clearing of indigenous Eucalyptus vegetation for development of dryland agriculture. Because of reduced evapotranspiration from crops and pasture there is excess water available to mobilize the large mass of salts stored in the deep profiles. The current understanding of the various mechanisms involved is reviewed. The development of a quantitative approach to the salinization problem has provided a basis for establishing appropriate methods for prevention and reclamation. (Halterman-PTT)

ERODING SOILS: THE OFF-FARM IMPACTS,
Conservation Foundation, Washington, DC.
E. H. Clark, J. A. Maverkamp, and W. Chapman.
1985. 252 p.

Descriptors: *Erosion control, *Sediment transport, *Soil erosion, *Soil conservation, *Nonpoint source pollution, Agricultural engineering, Farm management, Nutrients, Nitrogen, Phosphorus, Erosion rate, Water pollution effects, Precipitation, Pesticides, Bacteria, Viruses, Streams, Lakes, Reservoirs, Economic aspects, Recreation, Sedimentation, Fish, Environmental effects, Wildlife, Water quality, Eutrophication, Salinity, Water storage, Flood damage, Canals, Contours, Terracing, Land management, Sedimentation basins, Silting.

Erosion is a major problem, not only on agricultural land, but off the farm. Among erosion's impacts are waterways polluted by sediment, fertilizers, and pesticides; accelerated siltation of reservoirs and lakes; destruction of breeding grounds for fish and other aquatic life; and increased costs for dredging harbors; siltation in rivers leading to increased flooding. This comprehensive analysis of the off-farm problems reviews basic chemical, physical, hydrological, and ecological principles pertinent to the erosion problem. Detailed cost

estimates show that erosion causes $6 billion (1980 dollars) of damages each year in the U.S. Known erosion control techniques are discussed. No single technique or group of techniques is suitable and cost effective in all situations. In general, conservation tillage and contour plowing are less expensive than structural measures such as terraces and sediment basins. Nutrient transport is most easily controlled with terraces and contour plowing. Enough information exists to mitigate the most serious erosion problems. This may involve removing the most rapidly eroding land from row-crop production or completely from production. Farm management techniques are available to control off-farm erosion impacts. However, the question is whether U.S. society has the will to implement them. (Cassar-PTT)

A major problem associated with the analysis and toxicology of PCBs as well as other halogenated aromatics is the multiplicity of possible isomers and congeners. Furthermore, PCB toxicity is dependent on the structure of the individual compounds. Thus, the potential environmental and health impact of PCBs must account not only for the integrated quantification of the PCB mixtures, but also the concentrations of specific congeners which are potentially toxic. This work confirms the feasibility of high resolution PCB analysis of the commercial and environmental PCB mixtures. It is anticipated that this approach will be used to accurately measure the concentrations of specific PCB isomers and to determine the effects of PCB structures on their ecological dynamics. The methodology entails high resolution glass capillary column separation coupled with EC or MS detection and requires all 209 PCB reference standards for calibration. Data, in the form of high resolution capillary gas chromatograms, were presented for Aroclor 1016 singly and combined, as well as for a PCB fraction from a fish extract. (Halterman-PTT)

PHYSICAL CHEMICAL PROPERTIES OF POLYCHLORINATED BIPHENYLS,
Toronto Univ. (Ontario). Dept. of Chemical Engineering and Applied Chemistry.
D. Mackay, W. Y. Shiu, J. Billington, and G. L. Huang.
IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 59-69, 1 tab, 15 ref.

Descriptors: *Toxic wastes, *Polychlorinated biphenyls, Vapor pressures, Fugacity, *Solubilities, Henry's law constant, Octanol-water partition coefficient, Organic carbon sorption coefficient, Chemical partitioning, Biological magnification.

For predicting and interpreting the environmental behavior of PCBs, it is essential to have reliable data for their physical-chemical properties, notably those properties such as vapor pressure, aqueous solubility, Henry's law constant and the various partition coefficients such as those for octanol-water, organic carbon-water and biota water. Since it is not economically or practically feasible to derive these data for all 209 congeners, it is necessary to infer values for one compound from another. Results suggest that the addition of one chlorine reduces solubility and vapor pressure by approximately a factor of 3 (thus the Henry's law constant is little changed) and the octanol-water partition coefficient increases by a similar factor. The methodology for this study entailed reviewing the literature pertaining to the physical chemical properties of PCBs and compiling and statistically analyzing the available data. From these analyses selected values for the properties of congeners of Aroclor were inferred. (Halterman-PTT)

REACTIVITY AND ENVIRONMENTAL PERSISTENCE OF PCB ISOMERS,
Dow Chemical Co., Midland, MI. Environmental Sciences Research Lab.
W. B. Neely.
IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 71-88, 2 fig, 7 tab, 23 ref.

Descriptors: *Toxic wastes, *Polychlorinated biphenyls, *Polychlorinated biphenyl isomers, *Environmental persistence, Solubility, Vapor pressure, Fish, Transport bioaccumulation, Air-water interface, Biodegradation, Water pollution.

Analyses of environmental samples have often resulted in the identification of a variety of the components of PCB fluid, ranging from unsubstituted biphenyl to the fully chlorinated homologue. These component compounds were examined in an effort to identify the properties that cause certain congeners to accumulate in environmental systems. Water solubility, vapor pressure, boiling point and rate constants for microbial degradation are presented for a large number of homologues of PCB. These values were applied to a model constructed to describe the distribution of the homologues in the water column and fishes of Lake Michigan. Values of vapor pressure, water solubility, octanol water solubility and molecular weight that are associated with optimum accumulation of PCB-related compounds in fish must be sufficiently low in order that the chemicals can build up in the various environmental compartments. ESTIMATING BIOCONCENTRATION POTENTIAL FROM OCTANOL/WATER PARTITION COEFFICIENTS,
Environmental Research Lab.-Duluth, MN.
G. D. Veith, and P. Kosian.
IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 269-82, 3 fig, 2 tab, 2 ref.

Descriptors: *Path of pollutants, *Toxic wastes, Polychlorinated biphenyls, *Bioconcentration potentials, *Partition coefficients, Model studies, Bioaccumulation, Clorinated hydrocarbons, Fathead minnow, Bluegill, Rainbow trout, Mosquito fish, Coho salmon, Guppy, Flagfish, Spot, Sheepshead minnow, Carp, Channel catfish, Topmouth gudgeon.

A previously derived structure-activity relationship (SAR), which is used to estimate the bioconcentration potential of fish from the n-octanol/water partition coefficient (P), was calculated from data on approximately 50 tests on five general classes of chemicals. That SAR is summarized as: log BCF equals 0.85 log P - 0.70. To assure optimal accuracy in work involving estimating the bioconcentration of potentials, it is useful to determine if the most appropriate SAR is used. This study presents a new SAR, based on over twice as many tests as that previously described. Although the two are slightly different, they predict identical bioconcentration factors (BCF). The authors reviewed 122 tests in order to derive the new SAR, which is summarized as follows: log BCF equals 0.9 log P - 0.40. (Halterman-PTT)

NITORING OF PCBS IN WATER, SEDINTS AND BIOTA OF THE GREAT LAKES - IE RECENT EXAMPLES,
rio Ministry of the Environment, Toronto.
Kauss, K. Suns, and A. F. Johnson.
Physical Behavior of PCBs in the Great Lakes, Arbor Science, Ann Arbor, MI. 1983. p 385-11 fig, 4 tab, 11 ref.

riptors: *Toxic wastes, *Polychlorinated biyls, *Great Lakes, *Monitoring, Sediments, ara River, Freshwater clams, Sportfishes, ge fishes, Spottail shiners, Smallmouth bass, w perches, White sucker, Coho salmon, rican eel.

inued monitoring is an important aspect of our rstanding and predictive capabilities regarding s in the Great Lakes region. To this end, the rio Ministry of the Environment monitors PCBs in the waters, sediments and biota of the Great Lakes. Examples of the monitoring programs and some of the results are presented. Lake and river water, sediments, industrial and municipal inputs, suspended sediments, freshwater clams, sportfish and forage fish were sampled and analyzed. PCB concentrations in bottom sediments of the Niagara River sampled in 1979 ranged from non-detectable to 2700 micrograms per kilogram. Raw water sampled downstream of known sources had the highest PCB concentrations. PCB levels in migratory fish were not useful for pinpointing PCB sources. Young-of-the-year spottail shiners collected near specific sites thought to be sources, exhibited high PCB concentrations. Also, clams collected near certain sources had elevated levels of PCBs. SIMULATED PRECIPITATION REFERENCE MATERIALS, IV,
National Bureau of Standards (NML), Gaithersburg, MD.
W. F. Koch, G. Marinenko, and J. W. Stolz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB83-139378, Price codes: A02 in paper copy, A01 in microfiche. Report NBSIR 82-2581, June 1982. 17p, 12 tab, 10 ref. AD-13-F-2-535-0.

Descriptors: *Pollutant identification, *Water analysis, *Acid rain, Precipitation, Hydrogen ion concentration, Acidity, Precipitation, Standards, Chemical analysis, Trace elements, Conductance.

A fourth series of simulated precipitation reference material was characterized. Stability of samples from the first three series of simulated precipitation was evaluated. These samples, stored in glass ampoules, were not stable with respect to pH, conductance, acidity, alkali metals, and several of the transition elements. It was recommended that future sample series be divided--one set simulating the major components (mineral acids, alkali salts, and alkaline earth salts) and the other, stabilized with nitric acid, simulating the trace elements. All samples should be stored in clean polyethylene bottles. Variations in pH measurements using different electrodes indicated that this protocol needs revision. An interim pH measurement method is described. Determination of acidity by titrating to a fixed pH endpoint was not accurate enough for acid rain analysis. Preferred techniques are titration to an inflection point (or multiple inflection points for mixed acid systems) or the Gran method. (Cassar-PTT)

IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 445-454, 4 fig, 1 tab, 8 ref. CR808551.

Descriptors: *Pollutant identification, *Water treatment, *Activated carbon, *Organic compounds, Gas chromatography, Mass spectrometry, Extraction, Sample preparation, Filters, Solvents, Chromatography.

Solvent extraction with Soxhlet apparatus, solvent extraction with ultrasonic agitation, and thermal desorption were compared in desorbing organic matter in carbon samples from water treatment plants. Preliminary results indicated that thermal desorption was least time-consuming and gave a clearer picture of the early eluting components. However, some problems concerning the apparent loss of the high-boiling compounds and the possibility of thermal changes in composition warrant further study. Of the two extraction methods, ultransonic agitation seemed simpler, faster, and less error-prone. About 60 compounds or groups of compounds were identified. Many of these identifications have not been confirmed by comparison with authentic compounds. (Cassar-PTT)

ANALYSIS OF ORGANIC N-CHLORAMINES,
Old Dominion Univ., Norfolk, VA. Dept. of Chemical Sciences.
F. E. Scully, J. P. Yang, M. A. Bempong, and F. B. Daniel.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 555-561, 2 fig, 1 tab, 7 ref. CR807254-01.

Descriptors: *Pollutant identification, *Chloramines, *Water analysis, 5-Dimethylamino-1-naphthalenesulfinic acid, Chromatography.

Identification of N-chloramines in chlorinated water systems has been performed using a newly synthesized aromatic sulfinic acid (5-dimethylamino-1-naphthalenesulfinic acid monohydrate). This compound reacts with the chloramines to produce highly fluorescent dansyl derivatives. To detect chloramines at molar concentrations of 10 to the minus 6 power to 10 to the minus 4 power, the reagents are added to a test tube in the following order: 42 mg of sodium bicarbonate, 1 ml of chloramine solution, 1 ml acetonitrile, 100 microliters of 0.1 M solution of the sulfinic acid compound in 0.5M sodium bicarbonate, and 2 drops of 1M sodium hydroxide. The reagents are mixed, and the tube is sealed and placed in the dark for 3 hours. After extraction with chloroform, the product is concentrated for analysis by high performance liquid chromatography. Derivatives of chlorine and the following compounds have been studied: ammonia, aniline, sec-butylamine, ethylenediamine, piperidine, L-leucine. For N-chloropiperidine, the lower limit of detectability is about 10 ng. The fluorescence of the sulfinic acid derivatives is directly proportional to the original concentration of the underivatized N-chloramine. (Cassar-PTT)

NEW METHODS FOR GAS CHROMATOGRAPHIC ANALYSIS OF WATER POLLUTANTS,
Radian Corp., Austin, TX.

L. H. Keith, R. C. Hall, R. C. Hanisch, J. E. Henderson, and R. G. Landolt.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 563-582, 16 fig, 2 tab, 5 ref. 68-03-2965.

Descriptors: *Pollutant identification, *Chromatography, Gas chromatography, Chlorinated hydrocarbons, Organic compounds, Pesticides, Trihalomethanes, Acetonitriles, Polychlorinated biphenyls, Haloacetonitriles.

Two enhancements of gas chromatographic analysis for aquatic pollutants are described: the thermally modulated electron-capture detector (TMECD) and two-dimensional gas chromatography. The TMECD consists of two electron-capture detectors separated by a temperature-controlled pyrolysis unit. It relies on the differences before and after pyrolysis to produce a peak area ratio. Pyrolysis can affect signals in three ways--enhancement, diminishing, or no change--depending on the compound. With the two-dimensional system (post-detector-peak recycling) a sample is chromatographed on one column; the peaks of interest are trapped and thermally desorbed onto a second column, which differs from the first column. The compound can be identified using two retention times. These methods are applied to mixtures of haloacetonitriles and trihalomethanes in drinking water. The TMECD system is also applicable to mixtures of chlorinated hydrocarbon pesticides, polychlorinated biphenyls, and phthalate esters. (Cassar-PTT)

NEW DEVELOPMENTS IN DYNAMIC HEADSPACE ANALYSIS OF HALOGENATED ORGANICS,
A. R. Trussell, J. G. Moncur, F-Y. Lieu, R. R. Clark, and L. Y. Leong.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 583-592, 5 fig, 1 tab, 11 ref.

Descriptors: *Pollutant identification, *Chromatography, *Water analysis, *Organic compounds, Chlorinated hydrocarbons, Pesticides, Insecticides, Aromatic compounds, Capillary columns, Purge and trap procedures.

Use of capillary columns in the purge and trap technique for analysis of halogenated organics in environmental samples has improved quality assurance with capillary resolution. In addition the following advantages were shown: (1) Minimum detection limits for halogenated organics are in the low nanogram-per-liter range. (2) The purge-desorb-analyze procedure allows processing of two samples per hour. (3) The range of recovered compounds has been extended to include organics with boiling points as high as 300 degrees C, for example, dichlorobenzenes, trichlorobenzenes, hexachloroethane, hexachlorocyclopentadiene, hexachlorobutadiene, chlorinated naphthalenes, and chlorinated biphenyls. (4) The fused silica capillary column used in the volatile analysis is coated with liquid-phase SE-54, which also resolves other extractable chlorinated organics and pesticides. This allows simultaneous analysis of volatile and extractable chlorinated organics. (Cassar-PTT)
W86-02175

GAS CHROMATOGRAPHIC ANALYSIS OF PURGEABLE HALOCARBON AND AROMATIC COMPOUNDS IN DRINKING WATER USING TWO DETECTORS IN SERIES,
SRI International, Menlo Park, CA.
B. A. Kingsley, C. Gin, D. M. Coulson, and R. F. Thomas.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 593-608, 6 fig, 2 tab, 7 ref. 68-03-3031.

Descriptors: *Pollutant identification, *Water analysis, *Chromatography, *Organic compounds, Chlorinated hydrocarbons, Trihalomethanes, *Gas chromatography, Aromatic compounds.

Water samples were monitored for both halocarbons and aromatic compounds in a single analysis, using serially connected photoionization detection and electrolytic conductivity detection. This allowed resolution of many identification problems caused by coeluting compounds. The following advantages were demonstrated. (1) Greater sensitivity is obtained than can be obtained by effluent splitting. (2) More information is provided by the simultaneous analysis than by use of either analysis separately. Misidentification of benzene in samples containing trichloroethylene is eliminated. (3) The ability to confirm halocarbon contaminants in trihalomethane-containing water is greatly increased. (4) Analysis time and instrument costs are reduced because one gas chromography performs the work of two. (Cassar-PTT)

REVIEW OF ANALYTICAL METHODS FOR REACTIVE OXIDANT SPECIES IN CHLORINATED WATERS,
Oak Ridge National Lab., TN.
R. L. Jolley, and J. H. Carpenter.
IN: Water Chlorination: Environmental Impact and Health Effects: Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 611-652, 9 tab, 76 ref.

Descriptors: *Pollutant identification, *Literature reviews, *Water analysis, *Chlorine, Oxidation, Chemical analysis, Potentiometers, Amperometry, Colorimetry, Spectrophotometry, Chemiluminescence, Titrimetry, Seawater, Chloramines, Wastewater analysis.

The literature concerning analytical methods for active chlorine-containing species in water has been reviewed. A table summarizes the principal techniques currently in use, their applicability, and the lower limits of detection. These methods are potentiometry, spectrophotometry, colorimetry (8 specific methods listed), chemiluminescence, and titrimetry (4 specific methods listed). With currently available data, selection of a method most suitable for a particular water sample is difficult. EPA-recommended methods for chlorine in water are iodometric titration, DPD (N,N-diethyl-p-phenylenediamine)-colorimetric, or DPD-titrimetric. Specific methods are discussed for the following types of samples: natural and treated waters, polluted waters (which often have unsatisfied chlorine demand), and seawater. Criteria are given for making judgments on reported concentrations of chlorine or oxidants: water quality, analyst expertise, methodology, and statistical significance. Problems of detecting oxidants in the trace and parts-per-billion range are discussed. (Cassar-PTT)

CHLORINE ANALYSIS: PERSPECTIVES FOR COMPLIANCE MONITORING,
Public Service Electric and Gas Co., Newark, NJ.
R. Sugam.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 653-666, 1 fig, 5 tab, 11 ref.

Descriptors: *Pollutant identification, *Water analysis, *Chlorine, Oxidation, Residual chlorine, Monitoring, Amperometry, Titration, Seawater, Brackish water, Chlorine flux monitor.

Several methods for total residual chlorine analysis were evaluated in the field at fresh water, brackish water, and seawater sites. Methods included manual amperometric titration, automatic amperometric titration, amperometric back-titration, and chlorine flux monitor. Two amperometric (forward) titration methods (manual and automatic) were recommended as the best methods for low-level chlorine analysis. Under optimum conditions they can be used accurately and precisely to levels as low as 0.030 (manual) and 0.016 (automatic) mg/liter chlorine. Relative precision (95% confidence level) over a range of at least 1.0 mg/liter was +20%, -17% for the manual method and +30%, -23% for the automatic method. Cost of instrumentation for the manual method is considerably but endpoint detection is easier with autom titration. Analytical precision was poorest at seawater site, reflecting the more rapid decay brominated oxidants compared with chlorin analogs. The chlorine flux monitor recovered oxidant than the other methods at the brac water and seawater sites. It was not suitabl levels below 0.016 mg/liter. Back-titration re ered slightly less oxidant than forward titrat Amperometric back-titration was not suitable levels less than 0.061 mg/liter; it was too com for routine use. (Cassar-PTT)

EXPERIENCE WITH AMPEROMETRIC TRATIONS FOR TOTAL CHLORINE IN T MICROGRAMS-PER-LITER RANGE: LIMI TIONS TO ACCURACY,
Maryland Univ., College Park. Dept. of Che try.
G. R. Helz, D. A. Jaworske, and L. Kosak-Channing.
IN: Water Chlorination: Environmental Imp and Health Effects; Volume 4, Book 1: Chemi and Water Treatment, Ann Arbor Science, Arbor, MI. 1983. p 667-680, 5 fig, 1 tab, 19

Descriptors: *Pollutant identification, *Water a ysis, *Chlorine, *Amperometry, Iodine, Brom Oxidation, Trace levels, Accuracy, Residual c rine, Errors, Iodates, Chemical analysis.

Chemical factors which limit accuracy of amp metric titration of chlorine-produced oxidant natural water are related to iodine chemistry. tors affecting accuracy (systematic errors) incl additive errors (interferences from natural oxi ing agents such as oxygen or iodate ion, collo manganese tetrahydroxide, and reagent impurit and multiplicative errors (volatilization of iodin other oxidant species during determination). In water the disproportionation of iodine to f iodate can cause systematic underdeterminatio chlorine-produced oxidants by a factor of 3 more. The apparent rapid oxidation loss du analysis of free bromine is not caused primaril volatilization, but by formation of iodate. S precautions for minimizing the effect of system error on a result include (1) avoiding the mi order, (sample + buffer) + iodide, (2) using standard additions method with a minimum of additions, and (3) monitoring unchlorinated in water for interferences. SENSITIVE, SIMPLE DETERMINATION OXIDANTS IN CHLORINATED WATERS,
Rosenstiel School of Marine and Atmospheric ence, Miami, FL.
J. H. Carpenter, R. G. Zika, and C. A. Moore.
IN: Water Chlorination: Environmental Imp and Health Effects; Volume 4, Book 1: Chemi and Water Treatment, Ann Arbor Science, Arbor, MI. 1983. p 681-697, 9 fig, 14 ref.

Descriptors: *Pollutant identification, *Water a ysis, *Rhodamine B, *Fluorescence, *Chlor Oxidation, Bromine, Trihalomethanes, Orga compounds, Hypobromous acid.

The use of rhodamine B, a fluorescent compou was explored in a method for determining c rine-produced oxidant in water. The reaction hypobromous acid with rhodamine B was stu by adding increments of hypobromus acid to dye at pH 4 and a seawater bromide ion concen tion. The predominant species was molecular b mine. Fluorescence decreased in direct propor to the amount of added hypobromous acid. H ever, at concentrations lower than 0.004 ppm c rine equivalent the reaction of rhodamine B w hypobromous acid appeared to change charac Different ranges of chlorine equivalent were h dled by using four aliquots of sample and add different amounts of rhodamine B, correspond to 0.02, 0.10, 0.50, and 2.00 mg/liter chlo equivalent. Different responses of rhodamine were noted at pH 4 and pH 8. Four analyti classes were considered for differentiation:

chlorine, free bromine, combined chlorine, and combined bromine. Fluorescence decreases at pH 8 were greatest with HOBr, followed by HOCl, NHBr2, and NH2Cl. (Cassar-PTT)

imultaneous kinetic method of analysis for free combined chlorine-containing compounds is ible when using N,N-diethyl-p-phenylenedia-e (DPD) with an iodide catalyst. The sensitivi-f 1-2 micromoles is limited by the cell path th and the molar absorptivity of the oxidized D. Further investigations are aimed toward ering the detection limit of this technique to nanomolar levels by varying the primary re-ng agent. (Author)

ROVED DETERMINATION OF TOTAL IDUAL CHLORINE AT LOW (MICRO-M-PER-LITER) CONCENTRATIONS IN URAL WATERS,
York State Office of Public Health, Albany. er for Labs. and Research.
anelli, and S. O. Quinn.
Water Chlorination: Environmental Impact Health Effects; Volume 4, Book 1: Chemistry Water Treatment, Ann Arbor Science, Ann r, MI. 1983. p 733-741, 1 fig, 4 tab, 9 ref.

riptors: *Pollutant identification, *Water anal-*Chlorine, N,N-Diethyl-p-phenylenediamine, rimetry, Residual chlorine, Trace levels.

The N,N-diethyl-p-phenylenediamine (DPD) method combined with preliminary ethyl acetate extraction produces a simple, rapid colorimetric field method for determining total residual chlorine at a detection limit of less than 5 micrograms/liter chlorine. The method involves reduction of free or combined chlorine with an excess of potassium iodide at pH 4.7. The triiodide ion prepared is extracted with ethyl acetate and reacted with aqueous DPD reagents. The reaction product is then extracted into the water phase and measured spectrophotometrically at 515 nm. The ethyl acetate removes interferences from turbidity-causing substances such as insoluble carbonates, silicates, metal oxides, manganese dioxide, and plankton. (Cassar-PTT)

FLOW-STREAM DETERMINATION OF CHLORINE SPECIES WITH AN OXYGEN AMPEROMETRIC DETECTOR,
Wisconsin Univ.-Milwaukee. Center for Great Lakes Studies.
J. T. Coburn, J. B. Kafil, K. G. Schick, and C. O. Huber.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 743-750, 5 fig, 5 ref. 1435.

Descriptors: *Pollutant identification, *Water analysis, *Chlorine, *Chloramines, Amperometry, Hydrogen peroxide, Iodides, Electrodes, Trace levels.

A technique for rapid, direct, and sensitive determination of specific chlorine species below parts-per-million levels depends on the catalytic effect of iodide to separate chlorine species reacting in the following order: HOCl>NH2Cl>NHCl2. Iodide and hydrogen peroxide are added as individual streams to the sample. The detector consists of a Teflon membrane-covered circular, planar platinum electrode with an internal silver-silver chloride reference electrode. Limits of detection as mg/liter chlorine are as follows: HOCl, 0.008; NH2Cl, 0.08; and NHCl2, 0.2. Since monochlorinated amino acids react similarly to monochloramine, these compounds cannot be separately identified. (Cassar-PTT)

HYPOCHLORITE AND MONOCHLORAMINE DETERMINATIONS USING THE SILVER IODIDE VOLTAMMETRIC ELECTRODE,
Wisconsin Univ.-Milwaukee. Dept. of Chemistry.
T. N. Morrison, A. N. Tsausis, and C. O. Huber.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 751-759, 4 fig, 1 tab, 3 ref. 1435.

Descriptors: *Pollutant identification, *Water analysis, *Chlorine, Trace levels, Chloramines, Voltammetry, Hypochlorite, Monochloramine.

Silver iodide as a voltammetric electrode material provides for useful new chlorine species analytical methods. Configuration of the electrodes and nature of the applied potentials can be selected to optimize the measurements. Major advantages of the silver iodide electrode methods are: no reagents are required, data are rapidly accumulated, it is amenable to flow injection techniques, low (parts-per-billion) limits of detection are possible, the circuitry is relatively simple, and electrodes are easily prepared and maintained. A disadvantage of the silver iodide electrode is that no response has been observed for dichloramine at pH 7-8. This deficiency is somewhat offset by the instability of dichloramine at this pH. POTENTIOMETRIC TOTAL RESIDUAL CHLORINE ANALYSIS IN A CONTINUOUS-FLOW SYSTEM,
G. Scarano, M. G. Saroglia, and V. Festa.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 761-772, 8 fig, 2 tab, 9 ref.

Descriptors: *Pollutant identification, *Water analysis, *Chlorine, Electrodes, Oxidation, Seawater, Residual chlorine, Orion 97-70 electrode, Monitoring, Potentiometry.

The Orion 97-70 electrode is a rapid, simple means for continuous determination of low-level total residual oxidant in fresh water and seawater. The electrode responds rapidly enough for use in automated flow analysis. The sensor consists of a platinum redox electrode that develops a potential based on relative levels of iodine and iodide ions in solution and an iodide-ion selective electrode that develops a potential based exclusively on the iodide level in solution. The difference in these two potentials is related to the iodine concentration present in solution that is equal to the total residual oxidant concentration after reaction with the iodide reagent in a pH 4 acetate buffer solution. The accuracy and precision compare with those of the amperometric titration method. Since this sensor is not specific for chlorine, bromine oxidants are also included in the determination. The method is usable over a total residual oxidant range of 0.005 to 1 mg/liter. (Cassar-PTT)

MONITORING TOTAL RESIDUAL CHLORINE BY POTENTIOMETRIC ANALYSIS,
ORION Research, Inc., Cambridge, MA.
J. Soderberg, and J. Synnott.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 773-788, 7 fig, 2 tab, 12 ref.

Descriptors: *Pollutant identification, *Water analysis, *Wastewater analysis, *Chlorine, Oxidation, Potentiometers, Monitoring, Amperometry, Seawater, Cooling water.

Total residual chlorine was measured in five types of water samples by potentiometric and amperometric methods. The samples included cooling water, treated industrial waste from organic industries, treated industrial waste from inorganic industries, treated industrial waste from aluminum industries, and combined domestic/industrial/storm water treated waste. Excellent correlation between the two methods was obtained for all samples at the low part-per-billion level. The potentiometric method compared with the N,N-diethyl-p-phenylenediamine method in a drinking water sample also gave excellent correlation. A commercially available chlorine monitor performed satisfactorily in the field in three situations: river cooling water, treated municipal wastewater, and saline cooling water. (Cassar-PTT)

ENVIRONMENTAL 'TERMITE' INSPECTIONS,
W. A. Duvel.
IN: Hazardous Waste Management for the 80's, Ann Arbor Sciences, Ann Arbor, MI, 1982. p 143-162, 1 fig, 1 tab, 2 exhibits.

Descriptors: *On-site investigations, *Environment, *Pollutants, Economic aspects, Field tests, Groundwater, Water quality, Financial feasibility.

The Environmental Termite Inspection is a new term being applied to site evaluations conducted in relation to commercial and industrial real estate transactions. The inspection usually entails a source characterization, evaluation of hydrogeologic conditions, development of a site map, a detailed site reconnaissance, some subsurface exploration, some evaluation of the population potentially exposed, and a summary risk assessment. The importance of considering water features of the land is stressed, and techniques for non-invasive and invasive subsurface exploration are described. These techniques can include ground surface radar (for determining groundwater depth), resistivity testing, radioactivity detection, organic vapor detection, and analyses of water, soil, waste, and sludge samples. The inspection looks at what hazardous materials are present on the parcel of land; what pathways might serve as conduits for off-site migration; what population is exposed to these

materials; and what adverse conditions could result from this exposure. The cost of such investigations is considered, and the level of investigation required is discussed in relation to the proposed use of the land. (Halterman-PTT)

DETERMINATION OF 2,3,7,8-TETRACHLORODIBENZO-P-DIOXIN IN INDUSTRIAL AND MUNICIPAL WASTEWATERS, METHOD 613: DEVELOPMENT AND DETECTION LIMITS,
California Analytical Labs., Inc., Sacramento.
A. S. Wong, M. W. Orbanosky, P. A. Taylor, C. R. McMillan, and R. W. Noble.
IN: Chlorinated Dioxins and Dibenzofurans in the Total Environment, Butterworth Publishers, Boston, 1983. p 165-192, 9 fig, 1 tab, 4 ref.

Descriptors: *Chlorinated hydrocarbons, *Hydrocarbons, Chlorinated dioxins, Chemical analysis, Gas chromatography, Chromatography, Public health, Regulations.

As a result of public comment and recent advances in analytical procedures, the standard method of determination of 2,3,7,8-tetrachlorodibenzo-p-dioxin (2,3,7,8-tetra-CDD) recognized by the EPA has been developed. The final version of the procedure is typical of the methodologies developed for other priority pollutants requiring solvent extractables, except that the labelled internal standard is added to every sample. The aqueous sample is extracted with methylene chloride, which is then exchanged to hexane, which is then washed with 10 N NaOH and concentrated sulfuric acid, to remove acidic and basic co-extracts and any neutral compounds that react easily with concentrated sulfuric acid. The assay step is performed using a capillary column that gives a unique isomer-specific separation for 2,3,7,8-tetra-CDD and is coupled to an MS detector operating in the SIM mode. Criteria for qualitative confirmation are that the GC column be isomer-specific; all 2,3,7,8-tetra-CDD (native and internal standard) coelute; the chlorine isotope ratio is within 10% of the calibration standard; and all peaks are greater than 2.5 times the noise level. OCCURRENCE OF TETRACHLORODIBENZO-P-DIOXIN IN ENVIRONMENTAL SAMPLES FROM SOUTHWEST MISSOURI,
Environmental Protection Agency, Kansas City, MO. Region VII.
R. D. Kleopfer, W. W. Bunn, K. T. Yue, and D. J. Harris.
IN: Chlorinated Dioxins and Dibenzofurans in the Total Environment, Butterworth Publishers, Boston. 1983. p 193-201, 1 fig, 2 tab, 9 ref.

Descriptors: *Chlorinated hydrocarbons, *Water pollution, *Missouri, *Hydrocarbons, *Chlorinated dioxins, Chemical analysis, Gas chromatography, Public health, Ecosystems, Ecology, Fish.

Following the discovery of illegally disposed tetrachlorodibenzo-p-dioxin (tetra-CDD) in southwest Missouri, a series of investigations has been conducted to determine the extent of contamination in the area. Water, fish, soil, sediments and air samples were analyzed. The highest levels ranged from 33,000 to 343,000 ppb, found in storage tanks and a contaminated horse arena. The highest levels in fish were found in suckers, ranging from 5 to 55 ng/kg. The highest levels found in fish were from specimens collected from the area where the highest sediment levels were observed. Although clean-up efforts are underway, investigations and monitoring of the problems are expected to continue for several years to come. (Halterman-PTT)

COMPOSITION OF POLYCHLORINATED DIBENZOFURAN AND DIBENZO-P-DIOXIN RESIDUES IN SEDIMENTS OF THE HUDSON AND HOUSATONIC RIVERS,
Columbia National Fisheries Research Lab., MO.
J. D. Petty, L. M. Smith, P-A. Bergqvist, J. L. Johnson, and D. L. Stalling.
IN: Chlorinated Dioxins and Dibenzofurans in the Total Environment, Butterworth Publishers, Boston, 1983. p 203-207, 3 tab, 12 ref.

Descriptors: *Chlorinated hydrocarbons, *Hydrocarbons, *Chlorinated dioxins, *Chlorinated dibenzofurans, Chemical analysis, Gas chromatography, Chromatography, Mass spectrometry, Public health, Ecosystems, Ecology, Fish, Sediments.

The methodologies and results of analysis of sediment and fish samples, from the Hudson and Housatonic Rivers, for polychlorinated dibenzofuran and dibenzo-p-dioxin (PCDF and PCDD, respectively) are outlined. The variable results obtained indicate the need for additional work in this area. The samples contained both compounds, primarily the higher-chlorinated congeners. The hepta- and octa-congeners predominated in sediments and tetra- and penta-congeners predominated in fish. Insufficient evidence exists to determine the differences between the profiles in fish and sediments. (Halterman-PTT)

NEW GAS CHROMATOGRAPHIC DETECTOR FOR TETRACHLORODIBENZO-P-DIOXIN AND TETRACHLORODIBENZOBURAN ANALYSES,
Radian Corp., Austin, TX.
L. H. Keith, L. D. Ogle, A. E. Jones, R. C. Hanisch, and R. C. Hall.
IN: Chlorinated Dioxins and Dibenzofurans in the Total Environment, Butterworth Publishers, Boston. 1983. p 239-257, 12 fig, 8 tab, 4 ref.

Descriptors: *Chlorinated hydrocarbons, *Hydrocarbons, *Chlorinated dioxins, *Chlorinated dibenzofurans, Chemical analysis, Gas chromatography, Chromatography, Mass spectrometry, Public health, Ecosystems, Ecology.

Gas chromatography and a new prototype detector, a thermally modulated electron-capture detector (TMECD) appear to offer a unique new method for screening for tetrachlorodibenzo-p-dioxin and tetrachlorodibenzofuran at trace levels in complex samples. A great benefit of this method is its high sensitivity to most pollutants of interest. The lower limit of detection for these samples was about 1 ppb. The technique can be used to analyze tissues, fly ash, soil, water and transformer oils. It has the potential to save large sums of money because samples can be screened, and negative samples can be eliminated from costly mass spectrometry analyses. (Halterman-PTT)

HISTORICAL RECORD OF POLYCHLO
NATED DIOXINS AND FURANS IN L
HURON SEDIMENTS,
Indiana Univ. at Bloomington. School of P and Environmental Affairs.
J. M. Czuczwa, and R. A. Hites.
IN: Chlorinated Dioxins & Dibenzofurans in Total Environment II, Butterworth Publis Boston, 1985. p 59-63, 2 fig, 11 ref. 80EV-10

Descriptors: *Polychlorinated dibenzo-p-dio *Water pollution sources, *Chlorinated hydro bons, *Hydrocarbons, *Aquatic environment, ychlorinated dibenzofurans, Great Lakes, Huron, Gas chromatography, Mass spectrom Water analysis, Chemical analysis.

Sediment core sampling was used in a study signed to assess the historical input of combust generated polychlorinated dibenzo-p-dio (PCDD) and dibenzofurans (PCDF) into the ronment. The goal of the investigation wa determine whether these compounds (inclu some highly toxic isomers) are formed prim from the pyrolysis of chlorinated aromatic pre sors present in the fuel or are formed during combustion of naturally occurring organic ma als. Four core samples from southern Lake H were extracted with isopropanol followed methylene chloride, and final extracts were lyzed by gas chromatographic mass spectrom

sing methane-negative chemical ionization. This echnique allows determination of PCDD and CDF at low parts per trillion levels. The most bundant species tended to be the highly chlorinat- d PCDD and PCDF, with octachlorodioxin pre- ominating in all samples. There was no evidence f degradation of PCDD or PCDF. Depth vs. oncentration profiles show that the input of these wo compounds increased dramatically in approxi- ately 1940, which corresponds to an increased roduction of chlorinated aromatic compounds, ncluding those used in herbicides and wood pre- rvatives. Thus, combustion of municipal waste is ggested as a major source. It was concluded that e high levels found do not reflect natural com- stion processes, but rather anthropogenic com- stion, primarily combustion of chlorinated pre- rsors present in combustion fuels. scriptors: *Chlorinated hydrocarbons, *Hydro- bons, *Water pollution sources, *Chemical lysis, *Aquatic environment, Chromatography, achlorodibenzo-p-dioxin, 1,3,6,8-tetrachlorodi- zo-p-dioxin, Water analysis.

enable the environmental dynamics of the orinated dioxins octachloro-dibenzo-p-dioxin DD) and 1,3,6,8-tetrachlorodibenzo-p-dioxin ,6,8-TCDD) to be obtained by simple modeling ulations, key physical properties were deter- mined. The porperties studied were octanol-water partition coefficient and water solubility, since these are closely related to a substance's ability to pass through biological membranes and bioaccumulate or to partition between environmental media. A reversed-phase high-performance liquid chromatography method for determination of these two properties is presented. Since standard methods are not effective with these hydrophobic substances, a modification using a quadratic equation is presented. The data presented indicate that the quadratic-derived values of the log of the octanol-water partition coefficient for both 1,3,6,8-TCDD and OCDD agree with the water solubility-determined values very well. Descriptors: *Polychlorinated biphenyls, *Public health, *Social aspects, *Chemical analysis, Great Lakes, Political aspects, Water analysis, Monitoring, Toxicity, Fish, Gas chromatography, Chromatography.

The problems associated with the toxicology and analytical chemistry of polychlorinated biphenyls (PCBs) are primarily due to the large numbers of theoretically possible isomers. The toxicity of PCBs is a function of the structure of the individual isomer. It is not sufficient to quantify the total amount of PCBs present in an environmental sample; the concentrations of the isomers which are potentially more toxic must also be determined. High resolution gas chromatographic analytical techniques are outlined and examples of resultant chromatograms are presented. The use of high resolution capillary gas chromatography, in conjunction with the use of PCB isomers as reference standards, is presently a viable analytical technique for the analysis of commerical PCB formulations and environmental samples from many different matrices. WATER ANALYSIS, VOLUME 1: INORGANIC SPECIES, PART 1,
Academic Press, Inc., Orlando, FL. 1982. Edited by Roger A. Minear and Lawrence H. Keith. 287 p.

Descriptors: *Water analysis, *Reviews, *Trace elements, *Inorganic compounds, *Theoretical analysis, Organic compounds, Alkalinity, Acidity, Conductance, Dissolved soilds, Oxidation-reduction potential, Turbidity, Water quality, Natural waters, Wastewater analysis.

This volume is the first of three volumes designed to present both the theoretical and the practical aspects of understanding and determining the trace-level components that are found in all natural, pristine, and polluted waters. Volume I is the first of two focusing on the inorganic constituents in water. The first chapter presents a background on the inorganic constituents found in water. A general treatment of the sources of representative species found in both natural waters and wastewaters is followed by a discussion on the effects of hydrolysis, complexation, and dissolution in conjunction with redox and pH in the environmental dynamics of these species. Chapters 2 and 3 include a detailed discussion of these topics. The fourth chapter deals with conductance, a general measure of solution ionic content. The in-depth treatment of light scattering theory principles in Chapter 5 is intended to give the reader a sufficient understanding of the complexity of turbidimetric responses. Chapter 6 concludes the volumen with a survey of general water quality analytical procedures used for measuring individual inorganic species. (Geiger-PTT)

SUMMARY OF METHODS FOR WATER-QUALITY ANALYSIS OF SPECIFIC SPECIES,
Geological Survey, Arvada, CO. Water Resources Div.
H. E. Taylor.
IN: Water Analysis, Academic Press, Orlando, FL, 1982, Volume 1: Inorganic Species, Part 1. 1982, p 235-273, 2 fig, 7 tab, 42 ref.

Descriptors: *Water analysis, *Water quality, *Chromatography, *Electrochemistry, *Pollutant identification, *Spectrophotometry, Chemical

properties, Wastewater analysis, Natural waters, Gas chromatography, Conductance, Potentiometers, Mass spectrometry, Photometry, X-ray spectroscopy.

In the past 20 years, a variety of methods have been developed to solve specific analytical water quality problems. Several categories of analysis are available depending on the objective of the application. These are: qualitative, semiquantitative, and quantitative. Most modern methods of instrumental analysis base their quantitation on the method of direct comparison wiih a synthetic standard or a known concentration reference material for standardization. Classical methods are generally considered to be in one of two categories, either gravimetric or volumetric analysis. Usually classical method are not employed in the modern water quality laboratory because of their time requirements. Spectroscopic methods of analysis can be broken down into two major categories - absorption techniques and emission or fluorescence techniques. Molecular and atomic absorption methods are described. Emission methods examined include atomic emission, molecular emission, atomic fluorescence, x-ray fluorescence, neutron activation, and mass spectrometry. Electrochemical methods of water analysis can be grouped into several different categories. They include: potentiometric techniques, voltammetric techniques, amperometry, and conductance techniques. Chromatography is one of the most effectively known methods of separating interfering constituents prior to analysis. The principles of chromatographic analysis are described. (Geiger-PTT)

Descriptors: Groundwater, Geohydrologic units, *Water wells, Coastal Plain, *Water quality, Water temperature, *Aquifer testing, Borehole geophysics, Hydrographs, *Maryland, *Queen Annes County, Kent Island.

A test hole drilled on Kent Island, Queen Annes County, Maryland, to a depth of 2548 feet, penetrated 2518 feet of Coastal Plain sediments and 30 feet of the underlying bedrock. Drill cuttings, cores, and geophysical logs were used to identify five aquifers: the Patuxent, lower Patapsco, upper Patapsco, Magothy, and Aquia. Water samples and pumping test data obtained from wells completed in the aquifers wre used to determine the water quality and transmissivities of the aquifers. Transmissivity of each, in feet squared per day, was found to be >800, 1,400, 4,000, 5,800, and >320 respectively. Chemical analyses showed that water from each aquifer is fresh and is distinctly different in chemical character from the others. Iron exceeded the limit recommended by EPA for drinking water in each of the aquifers. Water in the deeper aquifers is soft but water in the Aquia aquifer has a hardness of 160 milligram/Liter. Water levels in the wells are (1) affected by tidal changes in nearby estuaries of Chesapeake Bay, and (2) are highest in the deepest aquifer (16 feet above sea level) and progressively lower in each of the shallower aquifers. Selected hydrologic data were collected between May 1979 and October 1981 at 59 sites on the Truckee River, 10 sites on selected tributaries and smaller diversions, and 9 sites on the Truckee Canal. The data were collected in support of the water-quality and hydrologic investigation components of the Truckee-Carson River-Quality Assessment by the U.S. Geological Survey. This report contains data from: (1) diel and antecedent measurements made in conjunction with four synoptic water-quality studies, (2) analyses of phytoplankton samples to supplement other biological data collected during the synoptic studies, (3) an investigation of surface and intragravel water quality to determine the suitability of the river as a spawning habitat for Lahontan cutthroat trout, (4) 10 water-temperature recorders, (5) 11 dye-tracer studies, (6) 5 gas-tracer reaeration studies, (7) summaries of dye-tracer travel times derived from the dye
reaeration studies, and (8) discharge measurem

The Hollywood Dump in north Memphis, Tenn
see is known to contain hazardous wastes. Moni
wells were installed and sampled to determine
contaminants have entered the underlying W
River alluvium and concentrated near the base
this unconfined aquifer. Four water-quality sa
ples were collected from each of nine moni
wells screened in the Wolf River alluvium at t
Hollywood Dump between June 1982 and Ju
1983. Also sampled during this period was o
well screened in the fluvial (terrace) depos
about one-half mile upgradient from the dump, a
three nearby wells screened in the Memphis Sa
artesian aquifer. Low levels of several orga
compounds, including heptachlor, chlordane a
chlordene, were detected in water from the W
River alluvium. High concentrations of barium a
arsenic were also detected. Water from the Me
phis Sand showed no traces of synthetic orga
compounds. Other constituents and propert
were found to be at levels that are normal for th
aquifer. Five of the Wolf River alluvium we
sampled were newly installed. Geophysical lo
made in these wells, supplemented by drillers lo
and split spoon samples, show that clay underl
the alluvial aquifer at the well locations. (USG

ailable from OFSS, USGS Box 25425 Lake-od, CO 80225. USGS Water-Resources Investi-ions Report 85-4029, 1985. 1 sheet, 3 fig, 1 tab, ref.

scriptors: *Groundwater pollution, Water qual- *Saline water intrusion, Aquifers, Groundwat- *Arkansas, Gulf Coastal Plain, Boeuf-Tensas in.

e occurrence of saline water in the alluvial ifer in the Boeuf-Tensas basin in southeastern ansas has been of increasing concern. A band saline water containing chloride concentrations greater than 50 milligrams per liter extends ough the entire length of the basin. The most erely affected area is located in the southern t of the basin where chloride concentrations are igh as 1,360 milligrams per liter. The origin of saline water in the alluvial aquifer is not defi-ly known, but can probably be attributed at t in part, to both upward movement from the ansas River. Upward instrusion of saline und water has probably occurred through one more of the following: 1) leakage where the kson confining unit is thinned or absent, 2) age along a fault, and 3) movement through ndoned oil and gas test holes. SIMULATED EFFECTS OF SURFACE COAL MINING AND AGRICULTURE ON DISSOLVED SOLIDS IN ROSEBUD CREEK, SOUTHEASTERN MONTANA,
R. F. Ferreira.
Available from OFSS, USGS BOX 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4101, 1984. 94 p, 4 fig, 25 tab, 43 ref.

Descriptors: *Coal mines, Strip mines, Dissolved solids, *Water pollution sources, irrigation effects, *Simulation analysis, *Surface mining, Rosebud Creek, *Montana.

Dissolved-solids concentrations in five reaches of Rosebud Creek in southeastern Montana were simulated to assist in evaluating the effects of surface coal mining and agriculture on the dissolved-solids concentration. A mass balance of streamflow and dissolved-solids load was used. Mined acreage, dissolved-solids concentrations in mined spoils, and irrigated acreage were varied in the model to study relative changes in the dissolved-solids concentration of each reach of Rosebud Creek. Both simulated monthly streamflow and dissolved-solids load generally are within the 95-percent confidence limits of the mean monthly values calculated for Rosebud Creek at the mouth near Rosebud, Montana. From May through September, the simulated mean monthly streamflows vary by no more than 15 percent of the historical mean values. Except for January, May, and December, the simulated mean monthly dissolved-solids loads vary by no more than 13 percent of the historical mean values. Simulations based on present mining show irrigation accounting for a larger cumulative percentage of dissolved-solids concentration (3.05 percent in reach 5) than mining (0.38 percent in reach 5). However, with full-scale mining, the cumulative percentage resulting from irrigation in reach 5 (2.50 percent) will be smaller than that resulting from mining (14.69). By not simulating mining of the Kirby coal deposit in reach 1, the cumulative percentage of dissolved-solids concentration resulting from mining in all reaches will be decreased to less than 6.00 percent.

COMPILATION OF DATA COLLECTED AND DERIVED FOR WATER YEARS 1980 AND 1981 FOR THE PURPOSE OF WATER-QUALITY MODELING OF THE LOWER OUACHITA RIVER AND SELECTED TRIBUTARIES, SOUTH-CENTRAL ARKANSAS,
Geological Survey, Little Rock, AR. Water Resources Div.
J. C. Petersen, and E. E. Morris.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Open-File Report 84-727, 1984. 130 p, 16 fig, 40 tab, 36 ref.

Descriptors: *Hydrologic data collection, *Water quality, *Dissolved oxygen, *Nutrients, Coliform, Stream discharge, Algae, Phytoplankton, Chlorophyll, *Arkansas, *Ouachita River, Periphyton, Stream geometry.

This report represents water-quality, sediment oxygen demand, phytoplankton, periphyton, bacteria, instantaneous and mean-daily discharge, stream geometry, time of travel, reaeration data and other water quality collected on the lower Ouachita River (from just upstream of Little Missouri River to Lock and Dam 6), West Two Bayou, Smackover Creek, Haynes Creek and selected tributaries. The data were collected primarily between August 1980 and September 1981. Over 100 sites were sampled, but most were sampled only during two intensive sampling periods in mid-August of 1980 and mid-September of 1981. The water-quality data include measurements of pH, specific conductance, dissolved oxygen, water temperature, whole-water nitrogen species, total phosphorus, total orthophosphorus, dissolved chlorides, dissolved sulfate, ultimate biochemical oxygen demand and organic carbon. The phytoplankton and periphyton data include measurements of chlorophyll a and b, taxonomic identification cell counts and weights. Limited precipitation data are also included. Maps and schematic diagrams of the lower Ouachita River, West Two Bayou, Smackover Creek and Haynes Creek drainage systems show the location of the data-collection sites within the area. (USGS)

GEOCHEMICAL PROCESSES IN THE GASCOYNE LIGNITE MINING AREA, BOWMAN COUNTY, NORTH DAKOTA,
Geological Survey, Reston, VA. Water Resources Div.
D. W. Fisher, D. C. Thorstenson, M. G. Croft, and R. L. Houghton.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4192, 1985. 80 p, 15 fig, 15 tab, 32 ref.

Descriptors: *Strip mines, *Water quality, *Groundwater, Chemical reactions, Carbon radioisotopes, Carbonates, Cation exchange, Aeration zone, *Coal mining effects, *Fort Union formation, *North Dakota, Dissolved gases, Gas analyses, Sulfate reduction.

A study was begun in 1975 to determine the geochemical processes that have affected groundwater quality as a result of a lignite strip mine at Gascoyne, North Dakota. Ground waters and surface waters on or near the mine were analyzed for major and minor dissolved constituents, tritium and carbon-13 isotopes, and dissolved gases. Compositions and carbon isotopes were determined in gas samples from various horizons at six unsaturated-zone sites. Mineralogic and cation-exchange data were obtained from core samples and surface solids from the mine and from nearby farms. Reactions that control ground-water chemistry at the mine include: (1) Oxidation of organic matter and ferrous iron minerals in the saturated zone; (2) Dissolution of C02, carbonates and sulfates in unsaturated-zone water; (3) Cation exchange reactions on clays and on lignite; (4) Sulfate reduction and pyrite deposition in the lignite; (5) leaching of halides and of organic matter from the lignite; and (6) Silicate hydrolysis near the lignite outcrop. Gascoyne area ground waters are near neutral to moderately alkaline sodium sulfate solutions containing several hundred to several thousand mg/L dissolved sulfate. Mining operations will probably increase the dissolved sulfate levels in the groundwater reservoir at Gascoyne. (USGS)

Available from the National Technical Information Service, Springfield, VA 22161 as DE82-020562,

Price codes: A03 in paper copy, A01 in microfighe. Report RHO-HS-SR--5P, July 1982. 43 p, 18 fig, 4 tab, 10 ref, 6 append. DE-AC06-77RL01030.

Descriptors: *Fate of pollutants, *Water pollution sources, *Radioactive wastes, *Radioisotopes, Tritium, Monitoring, Water quality, Groundwater pollution, Hanford Site, Nuclear reactors, *Washington.

Results of the 1981 groundwater monitoring program at the Rockwell Hanford Site Separations Area indicated few changes from 1980. Samples from monitoring wells were analyzed for total alpha, total beta, Co60, Ru106, Cs137, Sr90, tritium, uranium, and nitrate. Tritium levels exceeded the guidelines for tritium (3000 pCi/ml) iin three wells which monitor active sites. With the exception of tritium, all contamination greater than 10% of the guidelines was caused by past disposal to inactive sites. The zone of contamination appears stable and highly localized for the sites represented by these samples. Groundwater migrating out of the Separations Area at this time contain pollutants at levels less than the guidelines. (Cassar-PTT)

ASSESSMENT AND CONTROL OF WATER CONTAMINATION ASSOCIATED WITH SHALE OIL EXTRACTION AND PROCESSING,
Los Alamos National Lab., NM.
E. J. Peterson, A. V. Henicksman, J. P. Fox, J. A. O. O'Rourke, and P. Wagner.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82 019186, Price codes: A03 in paper copy, A01 in microfiche. Report LA-9084-PR; UC-91, April 1982. 48 p, 8 fig, 23 tab, 24 ref, 3 append.

Descriptors: *Water quality control, *Oil shale, Shales, Trace elements, Metals, Heavy metals, Leaching, *Water pollution sources.

Laboratory studies on the potential water contamination associated with oil shale operations, focus on the mineralogy, trace element concentrations in solids, and leaching characteristics of raw and spent shales. Process parameters in modified in situ retorting are extreme. Mineralogic characterization of field generated spent shales indicate that carbonate decomposition and silication reactions occurred in Retort 3E at Logan Wash, Colorado. However, evaluation of leachate compositions indicate that several environmentally sensitive trace elements, including K, Li, F, V, Pb, B, Mo, Ni, Se, and As are not rendered immobile by in situ processing and could be of environmental concern. These conclusions are verified by investigations of laboratory-generated spent shales. This report details the chemical, mineralogic, and solution behavior of major, minor, and trace elements in a variety of shale materials. Control technology research activities have focused on the definition of control technology requirements based on assessment activities and laboratory evaluation of alternative control strategies for mitigation of identified problems. The overall impact of in situ processing on groundwater quality appears to be less significant than previously believed. Most elements leached from spent shales are already elevated in most groundwaters. Analysis indicates that solubility controls by major cations and anions will aid in mitigating water quality impacts with the exception of V, Pb, and Se. With respect to in situ retort leaching, process control and multistaged counterflow leaching are evaluated as control strategies. (Cassar-PTT)

MECHANISMS FOR GROUNDWATER CONTAMINATION BY UCG: PRELIMINARY CONCLUSIONS FROM THE HOE CREEK STUDY,
Lawrence Livermore National Lab., CA.
F. T. Wang, S. W. Mead, and D. H. Stuermer.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-020348, Price codes: A02 in paper copy, A01 in microfiche. Report UCRL--88012, August 3, 1982. 12 p, 6 fig, 5 tab, 5 ref. W-7405-E-48.

Descriptors: *Water pollution sources, *Fate of pollutants, *Water quality control, *Coal gasification, Gasification, Pyrolysis, Hoe Creek, Wyoming, Groundwater pollution, Organic compounds, Ammonia, Leaching.

Changes in groundwater quality were monitored in 60 wells drilled near the three underground coal gasification experiments at Hoe Creek, Wyoming. Five mechanisms were proposed to explain how residual gasification products were introduced into groundwater. (1) Escaping hot product gases may pyrolyze surrounding coal along its natural cracks. This is most likely to happen in an overlying aquifer. However, sand layers are not readily contaminated in this manner. If this mechanism is valid, dewatering wells could lower system pressure and reduce the volume of escaping product gas. (2) After gasification, the residual heat inside the cavity produces further pyrolysis products. (3) Leaching of coal ash by returning groundwater liberates inorganic contaminants. (4) Overburden materials heated to various degrees are the source of inorganic substances which enter the groundwater. (5) Minerals are dissolved by carbon dioxide escaping from the cavity during gasification. These possible mechanisms may be considered in designing monitoring networks and control technologies. For example, in leaky coal seams, monitoring wells should be 100 m or more from the cavity. In a thick coal seam, some wells should be completed in the top portion of the bed. Contaminated groundwater may be treated by pumping water to the surface through a wall in the cavity. The quantity of pyrolysis products can be minimized by preventing gas losses. (Cassar-PTT)

SEDIMENT AND RADIONUCLIDE TRANSPORT IN RIVERS: FIELD SAMPLING PROGRAM FOR CATTARAUGUS AND BUTTERMILK CREEKS, NEW YORK,
Battelle Pacific Northwest Labs., Richland, WA.
W. H. Walter, R. M. Ecker, and Y. Onishi.
Report PNL-3117, Vol. 4, Summary Report. November 1982. 75 p, 41 fig, 10 tab, 6 ref, 2 append.

Descriptors: *Path of pollutants, *Radioactive wastes, *Surface waters, *Radionuclides, *Radioisotopes, Cesium-137, Strontium-90, Plutonium, Americum, Tritium, Curium, Rivers, Sediments, Transport, Buttermilk Creek, *New York.

A field sampling program was conducted on the Buttermilk-Cattaraugus Creek system, New York, to investigate the transport of radionuclides in surface waters as part of a continuing program to provide data for application and verification of Pacific Northwest Laboratory's (PNL) sediment and radionuclide transport model, SERATRA. Based on the evaluation of radionuclide levels in Cattaraugus and Buttermilk Creeks, the Nuclear Fuel Services facility at West Valley, New York, may be the source of Cs-137, Sr-90, Cs-134, Co-60, Pu-238, Pu-239, 240, Am-241, Cm-244 and tritium found in the bed sediment, suspended sediment and water of Buttermilk and Cattaraugus Creeks. Bed sediment, suspended sediment, and water samples were collected over a 45-mile reach of the creek system. Bed sediment samples were also collected at the mouth of Cattaraugus Creek in Lake Erie. Radiological analysis of these samples included gamma ray spectrometry analysis, and radiochemical separation and analysis of Sr-90, Pu-238, Pu-239, 240, Am-241 and Cm-244. Tritium analysis was also performed on water samples. (Author's modified abstract)

Research was conducted to answer the question of whether there is net transport of PCB vapor into or out of the water, a major problem remaining in determining the PCB budgets of the Great Lakes. These studies indicate that the net movement of PCB vapor is from the water to the atmosphere. The methods used to draw these conclusions involve determining the ratios of PCB concentrations in solution and in vapor above the solution. The ramifications of the results of this work with regard to precipitation are as follows: a water concentration of 1 ng/l of a PCB with Henry's law constant (HLC of 0.00033 atm-cu m/mol) will support a vapor PCB concentration of 13.3 ng/cu m. Thus, precipitation in equilibrium with an atmospheric vapor concentration of 2 ng/ cu m of PCB, will have a dissolved PCB concentration of 0.15 ng/l. This is a concentration two orders of magnitude or more lower than is normally found in precipitation and indicates that vapor scavenging can account for less than 1% of the wet deposition PCB inputs. Because of the high concentrations of PCBs in fish eaten by humans, it is important to understand the routes by which PCBs first enter the water and ultimately fish tissues. In order to evaluate these transport processes, it is instructive to study the environmental behavior of these compounds. The primary phenomenon noted here is the atmospheric removal of the particle-associated fraction. The overall input of PCBs to Lake Michigan was estimated to range from about 300 to 550 kg per year. These estimates were obtained by combining a series of models and data, obtained from published literature, which covered the major transport mechanisms. Estimates were made for inputs from vapor-particle partitioning, vapor washout, particle-associated washout, dry deposition of particle-associated PCBs, vapor phase transfer, bubble stripping and bubble bursting. EVIDENCE FOR THE ATMOSPHERIC FLUX OF POLYCHLORINATED BIPHENYLS TO LAKE SUPERIOR,
Minnesota Univ., Minneapolis. Dept. of Civil and Mining Engineering.
S. J. Eisenreich, and B. B. Looney.
IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 141-156, 1 fig, 3 tab, 36 ref.

Descriptors: *Path of pollutants, *Toxic wastes, *Polychlorinated biphenyls, *Great Lakes, *Lake Superior, Air-water Partition coefficients, Air pollution, Transport, Water pollution, Model studies, Air-water interface.

Because of the magnitude of the PCB concentrations in marine, the Great Lakes, and urban atmospheres, atmospheric transport has been implicated as a primary input pathway to aquatic ecosystems. The calculation of PCB vapor flux across the air/water interface, which is critically important in quantifying atmospheric inputs, is described and quantified. Determinations were made by using reported air/water partition coefficients and comparing the results to a surface flux estimated from PCB and temperature profiles observed in Lake Superior, July 1978. The surface influx of PCB from the atmosphere was estimated as about 0.02 to 0.2 micrograms per square meter per day as compared to the gas-phase controlled influx calculated as about 0.17 micrograms per square meter per day. ROLE OF SURFACE MICROLAYERS IN THE AIR-WATER EXCHANGE OF PCBS,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
C. P. Rice, P. A. Meyers, and G. S. Brown.
IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 157-179, 4 fig, 5 tab, 31 ref. NA-79 RA-H-00001 NA-80 AA-D-00072.

Descriptors: *Path of pollutants, *Toxic wastes, *Polychlorinated biphenyls, *Lake Michigan, *Air-water exchange, Surface microlayers, Air-water interface, Great Lakes, Aroclors, Suspended solids, Partition coefficients.

Recently, there is much interest in trying to explain the cycling of PCBs between the major environmental compartments, i.e., atmosphere, hydrosphere and lithosphere, and hence new compartments are being defined. One of these is the surface microlayer. Determinations of the concentrations of PCB in the microlayer and subsurface waters of Lake Michigan are presented. Results of these studies indicate that the portion of PCBs associated with the particulate phase is related to their cycling at this interface. Surface samples for the study were collected from throughout Lake Michigan during 1979 and 1980 with screen and plate samplers. Subsurface samples were collected from a 1 m depth. Data on concentrations of PCBs, suspended particulates, and partition coefficients for the surface microlayer and the subsurface waters are presented. (Halterman-PTT)

IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 181-211, 8 fig, 4 tab, 46 ref. R805172-01. R806084-01.

Descriptors: *Path of pollutants, *Toxic wastes, *Polychlorinated biphenyls, *Lake Superior, Great Lakes, Water pollution, Sediment-water interfaces, Suspended solids, Aroclors, Adsorption.

PCBs are refractory compounds resisting chemical and biological degradation and are predicted to remain active for decades to come. Consequently, it is important to determine the dynamics of these compounds in aquatic ecosystems. A summary is presented of the findings regarding PCBs in the waters of Lake Superior during 1978 to 1980. Samples were taken from subsurface and surface waters, extracted, and analyzed by gas chromatography. Data on variations in concentrations of PCBs in various regions of Lake Superior, as well as in-depth profiles, are presented. (Halterman-PTT)

Transport processes within the benthic boundary layer (BBL) are important in determining the residence times of compounds, such as PCBs, in the Great Lakes. A review of the available information on this topic is presented, as well as the results of studies on recent sediment accumulation, resuspension, and transport of PCBs within the BBL. Data from analyses of water column and sediment trap samples indicate that approximately 14% of the current water column inventory of particle-associated PCB can be accounted for by winter resuspension. Reentrainment of pore water-associated PCB is small, but may be significant if associated with soluble natural organics or colloidal material. The net effect of resuspension is to increase the residence time for contaminants in active ecosystems. (Halterman-PTT)

IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 245-267, 3 fig, 7 tab, 28 ref.

Descriptors: *Path of pollutants, *Toxic wastes, *Polychlorinated biphenyls, *Great Lakes, Sediments, Water pollution, Suspended solids, Lake Superior, Lake Michigan, Lake Erie, Lake Huron, Lake Ontario, Lake St. Clair.

PCBs are ubiquitous in the Great Lakes water column, sediment and fish. However, the extent of their distribution is thought to be best demonstrated in bottom sediment and sediment introduced by rivers and lake drainage. Levels of PCBs observed within the Lakes reflect point and diffuse sources from industrial regions (high levels) within the basin as well as widely dispersed origins from the atmosphere (low levels). This program entailed sampling a grid pattern of 216 stations in Lake Ontario in 1968; 176 stations in Lake Huron in 1969; 55 stations in Lake St. Clair in 1970 and 1974; 259 stations in Lake Erie in 1971; 214 stations in the Bay of Quinte in 1972-1973; 405 stations in Lake Superior, 115 stations in Georgian Bay and 55 stations in North Channel in 1973; and 279 stations in Lake Michigan in 1975. STEADY STATE MODELING OF TOXIC CHEMICALS-THEORY AND APPLICATION TO PCBS IN THE GREAT LAKES AND SAGINAW BAY,
Manhattan Coll., Bronx, NY.
R. V. Thomann, and J. A. Mueller.
IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 283-309, 11 fig, 4 tab, 14 ref. CR 07853-01.

Descriptors: *Path of pollutants, *Toxic wastes, *Polychlorinated biphenyls, *Great Lakes, Saginaw Bay, Model studies, Suspended solids, Water pollution, Toxicity transport, Volatility.

Understanding the fate of a chemical such as PCB in a natural water system one must recognize the dynamic relationship between atmospheres, water column andd sediments. However, there are several advantages to using steady state calculations. The authors developed a simplified steady state model that provides increased understanding of the processes that are operative and permits unambiguous estimations of model parameters. The mechanisms that result from the derivation of the model are presented, with specific reference to PCBs. The application of the model to Saginaw Bay and the Great Lakes as a whole is presented. Predictions of PCB loadings, volatilization, PCB concentrations, fluxes to sediments, and fluxes to downstream are also made. (Halterman-PTT)

IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 329-366, 15 fig, 9 tab, 19 ref.

Descriptors: *Path of pollutants, *Toxic wastes, *Polychlorinated biphenyls, *Great lakes, *Saginaw Bay, Aroclors, Lake Huron, Model studies, Suspended solids, Water pollution, Air pollution, Transport, Volatility, Sedimentation, Mass balance.

A serious problem concerning PCBs in the Great Lakes area is how long PCB concentrations in fish will remain above the FDA action limit of 5 mg per kg. Many 'reservoirs', including landfills, roads sealed with PCB-oil mixtures, contaminated sediments and long-range atmospheric transport and deposition, still act as sources of contamination, In order to answer questions posed by regulators concerning the possible future status of PCBs, studies were conducted on data obtained in the Great Lakes region during 1979. Studies resulted in the development of a model for the dynamic mass balance of PCB and suspended solids in Saginaw Bay. The model was used to determine volatilization rates and to estimate the expected longevity of PCBs in the system. The model was constructed with 1979 data on PCB concentrations in the water column (total, dissolved, particulate), suspended solids, mass PCB on solids and distribution coefficients. The best comparison of model simulations to the measured concentrations was made with the distribution coefficients for A 1242, of about 60% of those for A 1260 and with a volatilization rate for Aroclor 1242 of 0.2 m per day. The volatilization rate for a 1260 was determined to be no more than 0.05 m per day. The calibrated volatilization rate for Aroclor 1242 compares well with the theoretical value, but that calibrated for Aroclor 1260 is much smaller than the theoretical value. Total PCB is calculated to decrease by 90% within 10 years. (Halterman-PTT)

IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 411-422, 1 fig, 42 ref.

Descriptors: *Path of pollutants, *Toxic wastes, *Polychlorinated biphenyls, *Volatility, Sediments, Control techniques, Vegetation, Water pollution, Air pollution, Transport, Air-water interface, Waste dumps.

As for a number of toxic chlorocarbons, the volatilization losses of PCB are substantial in spite of very low vapor pressures. Studies were conducted on PCB volatilization, air monitoring, and PCB levels in vegetation. Data indicate that volatilization of PCBs can be an important source of air pollution under certain environmental conditions. PCB concentrations are fairly high in ambient air and in vegetation near PCB dump sites. Air concentrations are 0.002 to 0.11 of the sediment concentrations. Extremely high levels of PCBs (up to 2800 ppm) were found in plants growing on PCB dumps, while levels of 0.1 or 0.2 ppm were observed in plants collected in areas removed from known sources. APPLICATION OF A SEDIMENT DYNAMICS MODEL FOR ESTIMATION OF VERTICAL BURIAL RATES OF PCBS IN SOUTHERN LAKE MICHIGAN,
Environmental Research Lab.-Duluth, MN.
D. Weininger, D. E. Armstrong, and D. L. Swackhamer.
IN: Physical Behavior of PCBs in the Great Lakes, Ann Arbor Science, Ann Arbor, MI. 1983. p 423-439, 6 fig, 2 tab, 13 ref. 68-01-0502.

Descriptors: *Path of pollutants, *Toxic wastes, *Polychlorinated biphenyls, *Sedimentation, *Lake Michigan, Sediments, Water pollution, Model studies, Great Lakes, Transport.

The rate of recovery of Lake Michigan from PCB contamination is affected by the release of PCBs from the sediments. Sedimentation acts as a burial process, rendering the PCB-laden surficial sediments as sinks. A sediment dynamics model is presented for use in estimating these vertical burial rates. An expected response of Lake Michigan sediments to burying surficial PCBs is 5 - 10 years. It appears that the surficial sediments over most of the southern basin have reached their maximum PCB concentration and are now decreasing in concentration. (Halterman-PTT)

TIME PERSPECTIVE IN THE SUBSURFACE MANAGEMENT OF WASTE,
Pennsylvania State Univ., University Park.
R. R. Parizek.
IN: Hazardous and Toxic Wastes: Technology, Management and Health Effects, The Pennsylvania Academy of Science, Easton, PA. 1984. p 139-169, 8 fig, 8 tab, 24 ref.

Descriptors: *Fate of pollutants, *Water pollution sources, *Groundwater pollution, Organic compounds, Aquifers, Solute transport, Geohydrology, Geochemistry, Waste disposal, Rivers, Sediments, Lakes, Estuaries, Metals, Water quality.

Groundwater pollution from waste disposal sites may not be apparent in the short term. The time perspective is very important in waste management because many pollutant transport processes are not well understood on the scale of thousands of years. Of urgent concern are hydrologically active areas, land areas which contribute pollutants directly to ground and/or surface waters, even during minor precipitation events. Pollutants may enter drainage basins via the atmosphere, rivers and streams, groundwater, and erosion in lakes and estuaries. Each pathway has its own travel time, attenuation mechanisms, and control measure potential. The effects of toxic substances in lake sediments are exaggerated because of recycling and biomagnification. Wastes are characterized according to persistence and toxicity. Easily biodegradable substances are less likely to survive long-term transport in slowly moving systems, whereas highly persistent compounds and metals may pose hazards for many years. Conditions favoring contamination of groundwater are permeable surficial deposits, great differences in permeability between surface and bedrock layers, low relief terrain, drainage tiles, sinkholes, secondary openings in bedrock, shallow aquifers, and confined aquifers. Descriptors: *Water pollution sources, *Fate of pollutants, Coal gasification, Coal tar, Metals, Cyanide, Organic compounds, Adsorption, Wastewater treatment.

Coal tar, a byproduct of coal gasification, is a complex mixture of free carbon and up to 10,000 organic compounds, principally polynuclear aromatic hydrocarbons. In the past much of this by-product was disposed of in injection wells or lagoons. Several instances of drinking water well contamination by coal tar have been reported. The chief problems are taste and odor, heavy metals and cyanide. Free coal tar readily moves through the unsaturated zone only where the water table is deep or where the tar is less dense than water. In the saturated zone coal tar denser than water moves in a separate liquid phase according to the distribution of capillary pressure forces. At Stroudsburg, Pa., 8000 gallons of nearly pure coal tar have been recovered in a depression in relatively impermeable silty sand. Phenolics and naphthalene levels increase more rapidly in groundwater than simple dilution can produce. Available reme-

dial actions include containment with a bentonite slurry wall, pumping of coal tar collected in pools, ime treatment mixture with a proprietary diluent, ydraulic isolation, and emulsification with in situ vater flooding. However, these methods are costly nd not always immediately and totally effective. Cassar-PTT)

OCATING THE GROUNDWATER POLLUION SOURCES USING COMPUTER ODELS,
Drexel Univ., Philadelphia, PA. Dept. of Civil Engineering.
D. Hwang, A. Ayubcha, J. S. Chieh, and S. Richardson.
In: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 534-547, 9 fig. 4 tab, 5 ref.

Descriptors: *Groundwater pollution, *Water pollution sources, *Computer models, *Numerical analysis, *Solute transport, Test wells, Organic solvents, Fate of pollutants, Model studies, Monitoring.

Two different computer numerical approaches were used to locate groundwater pollution sources at the Emmaus site, Little Creek Valley, Pennsylvania: nonsequential and sequential optimization. Results for detecting trichloroethylene (TCE) pollution sources in test wells are presented. TCE in this site study is assumed to be a dissolved pollutant dispersed in and convected by the groundwater. The actual point source was later determined to be about 100 ft from the node showing the highest pollutant concentrations. The models were applied to solute transport studies for TCE at the Curtiss Cell Pollution Site in Southington, Connecticut. Initial investigations indicated that the groundwater pollution at the well may have started as early as 1955. The results clearly demonstrate that there is an area-source in the northwest side of Quinnipac River and a point source south-southwest to one of the production wells. The computer prediction of area source location agrees quite well with the actual field investigation results. This technique holds the promise of being able to determine where additional wells should be located for on-going pollution monitoring. (Geiger-PTT)

IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 97-112, 4 fig, 2 tab, 12 ref.

Descriptors: *Fate of pollutants, *Wastewater treatment, *Chlorination, *Chloramines, Model studies, Colorado Front Range, Effluents, Kinetics.

A modeling approach has been developed based on several Colorado Front Range streams in the vicinity of chlorinated wastewater treatment plant effluent discharges to estimate the persistence of chloramines in natural water systems. It was found through a series of simple measurements and tests that rate constants can be developed to describe the dissipation rate of chlorine and its dilution so that estimates can be made of the persistence of the chlorine downstream of the wastewater treatment plant discharges. This approach reliably predicts chlorine persistence in most sites evaluated and has been verified to a limited extent in Colorado Front Range streams. (Author)

EFFECT OF BROMIDE AND NITRITE ON THE DEGRADATION OF MONOCHLORAMINE,
California Univ., Berkeley. Lawrence Berkeley Lab.
R. L. Valentine, and R. E. Selleck.
IN: Water Chlorination: Environmental Impact and Health Effects: Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 125-137, 7 fig. 2 tab, 14 ref. W-7405-eng-48.

Descriptors: *Fate of pollutants, *Chlorination, *Chloramines, Nitrites, Bromides, Monochloramine, Chemical degradation, Catalysts, Kinetics, Oxidation.

The effect of nitrite on monochloramine disappearance in the presence of bromide was evaluated by measuring total oxidant concentration with time using monochloramine with nitrite, with bromide, and with nitrite and bromide. Nitrite in the presence of bromide greatly accelerated the rate of oxidant decay, which was independent of the initial monochloramine concentration. The nitrite was not significantly consumed in a 1:1 stoichiometric oxidation by monochloramine. If the effect of nitrite is catalytic, it may also accelerate other oxidation-reduction reactions. If not, a complex-oxidation reduction, possibly involving bromide as a catalyst, is indicated. (Cassar-PTT)

CHEMISTRY OF COMBINED RESIDUAL CHLORINATION,
California Univ., Berkeley. Div. of Sanitary, Environmental, Coastal, and Hydraulic Engineering.
S. F. Leao, and R. E. Selleck.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983, p 139-149, 6 fig, 10 ref. W-7405-eng-48.

Descriptors: *Fate of pollutants, *Chlorination, *Chloramines, Chlorine residual, Kinetics, Ammonia, Chemical degradation.

The decomposition of monochloramine and dichloramine was observed at pH 6.6. Monochloramine decayed continuously (described as second-order at low concentrations), reaching a rather flat peak at about 120 hours. Dichloramine concentrations increased slightly up to about 10 hours, then continuously decreased. The overall second-order rate decreased with larger ammonia concentrations. The concentration of dichloramine was more or less independent of ammonia concentration. This shows that, in the absence of free chlorine, the concentration of ammonia does not appear to affect the rate of disappearance of the residual other than through the formation of NHC12 by NH2C1 hydrolysis. The reaction between NHC12 and ammonium ion to form NH2C1 is either much slower than reported or has a rate-limiting step not involving ammonia or ammonium ion. (Cassar-PTT)

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, *Aromatic hydrocarbons, Chlorine, Chlorine dioxide, Polynuclear aromatic hydrocarbons, Organic compounds, Oxidation, Kinetics.

Substituting chlorine dioxide for chlorine in water treatment was studied by treating aqueous solutions of polynuclear aromatic hydrocarbons (PAHs) with either compound. Two major considerations were indicated. (1) The reaction rates of chlorine dioxide with PAHs in water were slower than those of chlorine. Chlorine dioxide reactions paralleled the half-wave potential of the PAHs. (2) The products formed by reaction of the PAHs with chlorine and chlorine dioxide were generally similar (phenols, quinones, chloro derivatives) with structural variations dependent on the particular reactive species such as molecular chlorine, hypochlorous acid, hypochlorite, or hlorine dioxide). A table lists about 20 PAHs and their reaction times, and depicts the structures of the reaction products. (Cassar-PTT)

REACTIONS OF CHLORINE AND CHLORINE DIOXIDE WITH FREE FATTY ACIDS, FATTY ACID ESTERS, AND TRIGLYCERIDES,
Florida Univ., Gainesville. Dept. of Food Science and Human Nutrition.
H. A. Ghanbari, W. B. Wheeler, and J. R. Kirk.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 167-177, 1 fig, 3 tab, 10 ref. PFR 78-27067.

Descriptors: *Fate of pollutants, *Chlorination, *Lipids, *Fatty acids, *Organic compounds, Chlorine, Chlorine dioxide, Triglycerides.

The following lipids were chlorinated with hypochlorous acid and chlorine dioxide: oleic acid, methyl oleate, linoleic acid, methyl linoleate, linolenic acid, methyl linolenate, arachidonic acid, methyl arachidonate, triolein, olive oil triglycerides, and wheat germ triglycerides. Rate constants were determined. The free fatty acids were more reactive toward the chlorinating agents than their corresponding esters. For example, the rate constant for hypochlorous acid reacting with oleic acid was -11.44 per min; foor methyl oleate, -76.13 per min. Reaction with labeled chlorinating agents showed that fatty acids incorporated more chlorine than the corresponding esters. Oleic acid reacted with hypochlorous acid for 60 min incorporated 10.4% of the chlorine; methyl oleate, 1.67%. The major product of oleic acid and hypochlorous acid was identified as 9-chloro, 10-hydroxyl methyl stearate. (Cassar-PTT)

CHLORINATION PRODUCTS FROM AQUATIC HUMIC MATERIAL AT NEUTRAL PH,
North Carolina Univ. at Chapel Hill. School of Public Health.
D. L. Norwood, J. D. Johnson, R. F. Christman, and D. S. Millington.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 191-200, 3 fig, 1 tab, 14 ref. CR 806679.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, *Humic acids, *Fulvic acids, *Organic matter, Chlorine demand, Organic compounds, Aromatic compounds.

Products of the aqueous chlorination of a natural humic material at pH 7 were identified with a double-focusing, magnetic mass spectrometer capable of fast scan rates. Three common features were noticeable. (1) All compounds were methyl esters with the exception of chloroform and chloral. (2) Most compounds contained chlorine. Examples are methyl mono-, di-, and trichloroacetate, methyl-2,2-dichloropropionate, dimethylmonochlorosuccinate, dimethylmonochloromaleate, dimethyldichloromalonate, dimethyldichlorossucinate, and dimethyldichloramaleate. (3) Most non-chlorine-containing compounds were aromatic. Examples are dimethylphthalate and isomers, benzene tricarboxylic acid trimethyl ester, and benzene tetracarboxylic acid tetramethyl ester. Both fulvic acid and humic acid fractions produced extremely similar products. However, the fulvic chlorination sample contained 60% more organically bound chlorine than the humic sample, even though the reaction time of the humic sample was twice as long. (Cassar-PTT)

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, *Fulvic acids, *Chlorine dioxide, Chlorine demand, Organic matter.

The oxidation of aquatic humic materials by chlorine dioxide was conducted at ph 7.8 to simulate natural surface water conditions and at pH 3 to take advantage of the full oxidizing activity of chlorine dioxide. About 70% of the original total organic carbon was recovered after the reaction; about 30% was lost as carbon dioxide or other volatile compounds. Products isolated represented only a small fraction of the initial fulvic material, much of which did not degrade sufficiently for analysis by the techniques used. Products produced at pH 7.8 and at pH 3 did not differ significantly. Of the identified compounds, most were methyl esters of the following classes: benzenepolycarboxylic acid methyl esters, aliphatic dibasic acid dimethyl esters, carboxyphenylglyoxylic acid methyl esters, and aliphatic acid monomethyl esters. Benzene di- and tricarboxylic acid methyl esters and palmitic esters and their isomers were found in abundance in both the undegraded control and the chlorinated product mixture. Also identified were methylated aromatic derivatives of glyoxylic acid, furan and dioxane derivatives, monochloromalonic acid dimethyl ester, monochlorosuccinic acid dimethyl ester, and dichloroacetic acid methyl ester. Results indicate that, at neutral pH, only limited reaction occurs between chlorine dioxide and aquatic fulvic acid. (Cassar-PTT)

INFLUENCE OF AQUATIC HUMIC SUBSTANCE PROPERTIES ON TRIHALOMETHANE POTENTIAL,
Canada Centre for Inland Waters, Burlington (Ontario).
B. G. Oliver, and E. M. Thurman.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 231-241, 3 fig, 2 tab, 26 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, *Humic acids, Organic matter, Chlorine demand, Color, Trihalomethanes, Chlorinated hydrocarbons, Fulvic acids, Phenols.

There are site variations in trihalomethane (THM) potential for humic materials from diverse climatic and geologic environments. Groundwater humics had the lowest THM potentials, marsh-bog humics had the highest THM potentials, and surface water humics had intermediate THM potentials. Trends of higher THM potential with higher phenolic content and larger molecular size were observed, but the best correlation was between THM potential and color. Color was used to predict the THM potential of various natural waters. (Author)

EMPIRICAL MODEL FOR PREDICTING CHLOROFORM FORMATION FROM HUMIC AND FULVIC ACIDS,
B. A. Engerholm, and G. L. Amy.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 243-252, 3 fig, 2 tab, 16 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, *Organic matter, Humic acids, Fulvic acids, Chlorine demand, Model studies, Trihalomethanes, Chloroform, Chlorinated hydrocarbons.

A multiparameter equation was developed for predicting chloroform formation from humic substances in water. The basic equation for humic acid encompasses the reaction time, temperature, pH, and the initial total organic carbon and chlorine/total organic carbon ratio. Also presented is a generalized equation, containing precursor-related constants, for predicting the chloroform concentration derived from fulvic acid or other precursors. Application of this equation is limited to situations in which a free chlorine residual is present and requires caution for reaction times of less than 1 hour or greater than 96 hours. (Author)

IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1; Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 253-267, 6 fig, 2 tab, 20 ref. C3049NAET.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, *Organic matter, Resorcinol, Dihydroxybenzenes, Aromatic compounds, Trihalomethanes, Chloroform, Bromoform, Chlorine demand, Bromination, Chemical reactions.

Halogenation of labeled resorcinol (1,3-dihydroxybenzene) produced labeled chloroform, labeled bromoform, and other products. This indicates that trihalomethane formation occurs via electrophilic halogenation and subsequent bond clevage at the C2 site of the aromatic ring. Five generalizations were made from this study. (1) In acidic, neutral, or alkaline solution 1,3-dihydroxyaromatic substrates react with chlorine and bromine to produce higher yields of chloroform and bromoform than do the corresponding 1,2- and 1,4-dihydroxy isomers. (2) Maximum yields of trihalomethanes from 1,2-dihydroxyaromatic compounds occur between pH 8 and 10. (3) Bromination of acetone, 2-butanone, and 2-pentanone shows pH dependence of bromoform yields. Chlorination of these compounds does not produce significant chloroform. (4) All bromination reactions produce equivalent yields of bromoform as measured by direct injection analysis. Chlorination reactions produce higher yields for each substrate at low pH. This difference may have been the result of formation of labile chloroform-substituted intermediates in acidic solution which decomposed to chloroform during analysis. (5) Each 1,3-dihydroxyaromatic substrate shows a maximum chloroform or bromoform yield at a reactant ratio (halogen/substrate) of 7, except for 1,3-dihydroxynaphthalene (Maximum at 5:1). (Cassar-PTT)

KINETICS AND MECHANISM OF HALOFORM FORMATION: CHLOROFORM FORMATION FROM TRICHLOROACETONE,
Drexel Univ., Philadelphia, PA. Environmental Studies Inst.
M. D. Gurol, A. Wowk, S. Myers, and I. H. Suffet.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 269-284, 9 fig, 3 tab, 16 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, Chlorine demand, Chloroform, Trichloroacetone, Organic compounds, Chlorinated hydrocarbons, Chemical reactions, Hydrolysis.

The kinetics and mechanism of trichloroacetone (TCA) degradation was studied to determine

whether any chloroform is formed by this pathway. TCA at concentrations of 7 to 40 mg/liter was reacted at 25 degrees C at pH of 6 to 8 in the presence of 0 to 75 mg/liter chlorine. Hydrolysis and chlorination of TCA occurred simultaneously in chlorinated water. The total rate of chloroform formation by these two reaction pathways is too slow to account for the chloroform concentrations observed under typical conditions of water treatment. For example, at pH 7 and with free available chlorine of 10 mg/liter, only 10% of TCA degrades into chloroform during a contact time of 60 min. This corresponds to the formation of about 0.07 micrograms/liter of chloroform if the steady-state concentration of TCA in water is 1 microgram/liter. An additional 3 microgram/liter of chloroform is expected to form in the distribution system after 5 days in the presence of 2 mg/liter free available chlorine. A reaction that causes further halogenation of the chlorinated intermediate with eventual degradation to chloroform occurs simultaneously with hydrolysis of the chlorinated intermediate to chloroform, as opposed to the haloform reaction. The reaction between TCA and chlorine is faster than the hydrolysis reaction for chlorine concentrations above 1.5 mg/liter and at neutral pH. (Cassar-PTT)

QUANTITATIVE EFFECTS OF BROMINE ON THE FORMATION AND DISTRIBUTION OF TRIHALOMETHANES IN GROUNDWATER WITH A HIGH ORGANIC CONTENT,
Florida International Univ., Miami. Drinking Water Quality Research Center.
W. J. Cooper, L. M. Meyer, C. C. Bofill, and E. Cordal.
IN: Water Chlorination: Environmental Impact and Helath Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 285-296, 8 fig, 1 tab, 15 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, Chlorine demand, Bromides, Chlorinated hydrocarbons, Trihalomethanes, Organic matter.

The effect of bromide on trihalomethane (THM) formation was studied at four levels of added bromide (0.008, 0.08, 0.8, and 8.0 mg/liter) and four levels of added chlorine (8.35, 16.7, 25.1, and 33.4 mg/liter). Water used in the experiments was lower Florida peninsula groundwater with 6 mg/liter total organic carbon and 50 units of color. The presence of bromide significantly affected the formation and distribution of THMs. The chloroform concentration differed only slightly between the natural groundwater and bromide-augmented groundwater at the lower two bromide levels (at all levels of added chlorine) indicating that a minimum bromide concentration is necessary to influence chloroform formation. However, at the higher bromide concentrations chloroform concentration decreased significantly. The effect of bromide on CHC12Br formation was also minimal at the two lowest bromides levels. At 0.8 mg/liter bromide the CHC12Br level increased; at 8.0 mg/liter bromide, its formation was retarded. Formation of CHC1Br2 and bromoform increased with added bromide, but the relationships were not linear. The total concentration of THMs formed was not influenced greatly by bromide addition. FORMATION OF BROMINATED TRIHALOMETHANES: EXTENT AND KINETICS,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
J. P. Gould, L. E. Fitchhorn, and E. Urheim.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 297-310, 7 fig, 2 tab, 8 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, Bromination, Trihalomethanes, 2,46-Trihydroxyacetopheonone, Organic compounds, Chlorine demand, Kinetics, Chemical reactions, Model studies.

A bromine incorporation factor was used to examine trends in the extent and rate of formation of brominated trihalomethanes (THMs). This factor represents bromination as a single quantitative measure, greatly simplifying the interpretation of data on the concentrations of the four THMs (CHC13, CHC12Br, CHC1Br2, and CHBr3). Phloroacetophenone (2,4,6-trihydroxyacetophenone) was selected as the model precursor. The degree of bromine incorporation was dependent on the initial characteristics of the reaction system (pH, bromide concentration, HOC1 concentration, precursor concentration) but largely independent of time. An extension of an empirical model developed by Kavanaugh for chloroform was also used to study the kinetics of individual THM formation. On the basis of this mode, bromination kinetics were substantially faster than chlorination kinetics. These studies show that a conclusive model for THM formation kinetics cannot be developed until the complete mechanism of THM formation has been fully explained. (Cassar-PTT)

BROMOFORM PRODUCTION IN TROPICAL OPEN-OCEAN WATERS: OCEAN THERMAL ENERGY CONVERSION CHLORINATION,
California Univ., Berkeley. Lawrence Berkeley Lab.
E. O. Hartwig, and R. Valentine.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 311-330, 6 fig, 7 tab, 22 ref. W-7405-eng-48.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, Bromoform, Trihaomethanes, Chlorine demand, Organic matter, Ocean Thermal Energy Conversion process, Hawaii, Cooling water, Evaportation discharge, Condensers, Seawater.

Formation of bromoform and other volatile organics during chlorination of evaporator and condenser seawater used for the Ocean Thermal Energy Conversion process is reported. Bromoform was the major halogenated organic compound produced as a result of chlorinating seawater at chlorine doses less than 1 mg/liter. Significantly greater quantities of bromoform were produced in evaporator water than in the condenser water as a function of total residual oxidant in both chlorinated and dechlorinated (with sodium thiosulfate) stored samples. No immediate bromoform production was detected in the dechlorinated condenser water, but 1-2 micrograms/liter was immediately produced in dechlorinated evaporator water. The difference in bromoform concentrations of dechlorinated evaporator and condenser water was related to water quality. Mean values for pH and total organic carbon (micrograms/liter) for evaporator water were 8.27 and 1.17; for condenser water, 7.64 and 0.758. Evaporator water temperature was about 25 degrees C; condenser water 5.6 degrees C. Daily potential bromoform production by this plant with a mixed discharge of 34.9 million liters/hour, 0.2 mg total residual oxidant/liter, and 2 hours of chlorination per day equals 1.3 billion micrograms. Considering a 20-fold dilution within 2 hours, the bromoform concentration of the discharge water would be 0.93 micrograms/liter. (Cassar-PTT)

DISPERSION OF CHLORINE AT SEVEN SOUTHERN CALIFORNIA COASTAL GENERATING STATIONS,
Southern California Edison Co., Rosemead.
R. S. Grove.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 333-346, 5 fig, 3 tab, 6 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, *Cooling water, Powerplants, Southern California Edison Company, Seawater.

The fate of chlorine in powerplant cooling systems and the dispersion of chlorine in receiving waters were monitored at seven coastal generating stations of the Southern California Edison Company. Remarkable variability was observed in chlorine injection concentrations, condenser outlet concentrations, outfall concentrations, and dissipation rates among the generating stations. Less variability was seen within surveys done at the same generating station. No patterns of chlorination could be discerned among the data except for one station with a rigorous chlorine control program. Chlorine levels were below the detectable limit of 0.08 mg/liter at over half of the plant outfalls. The surveys also showed that a much higher level of coordinated chlorine assessment work is necessary to fully characterize factors controlling chlorine release to the environment. These factors, which are site-specific, include (1) seasonal varability in water chlorine demand and slime growth in condenser tubes, (2) chlorine demand of piping and conduits beyond the condensers, (3) influence of macrofouling control heat treatment methods on chlorine demand, and (4) scouring effect of silty water on condenser tubes. (Cassar-PTT)

MODEL FOR PREDICTING CHLORINE CONCENTRATION WITHIN MARINE COOLING CIRCUITS AND ITS DISSIPATION AT OUTFALLS,
Central Electricity Generating Board, Fawley (England). Marine Biological Unit.
M. H. Davis, and J. Coughlan.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 347-257, 5 fig, 1 tab, 18 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, *Cooling water, Chlorine demand, Model studies, Seawwater, Powerplants.

A model for predicting the behavior of chlorine in powerplant cooling systems using seawater differs from previous models in two ways: (1) it supposes an exponential, rather than a hyperbolic decay and (2) it accomodates discrete rate constants for the discharged and receiving waters. Temperatures decrease only slightly in discharge canals, allowing a high decay rate. Dilution is responsible for the most significant decreases in temperature and chlorine concentration. Simulations show that the chlorine loss curve generated by serial dilutions is steeper than the theoretical dilution curve, even when allowance is made for continuing decay. This is partially explained by the additional chlorine demand introduced with the diluting water. Instantaneous chlorine demand is higher at open-coast sites than at estuarine sites. The decay curve of chlorinated samples, from open-coast sites, regenerates a breakpoint curve which is out of phase with the original. The decay of estuarine samples does not regenerate a pronounced breakpoint. (Cassar-PTT)

WATER CHLORINATION PROGRAMS AT ONTARIO HYDRO FOSSIL-FIRED GENERATING STATIONS,
Ontario Hydro, Toronto.
F. Butler, R. Kozopas, G. T. Haymes, and J. S. Griffiths.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 359-372, 6 fig, 3 tab, 4 ref.

Descriptors: *Fate of pollutants, *Water pollution effects, *Chlorination, *Fish, *Cooling water, Rainbow smelt, Smelt, Fish eggs, Eggs, Larvae, Lambton Generating Station, Lakeview Generating Station, R.L. Hearn Generating Station, Powerplants, Toxicity.

A chlorination regimen for controlling biofouling has been developed for Ontario Hydro's Lambton Thermal Generating Station. Normal maintenance chlorine dose is 0.19 kg/min for 20 min, twice a week. To combat excessive biofouling, shock chlorination in stages up to 900 kg/day for 30 min is used. During chlorination, adult fish (white bass and suckers) show an avoidance response at chlo-

rine concentrations below reported lethal concentrations. This response involves increased activity toward areas of reduced chlorine concentraion. Chlorine plume studies at three coal-fired stations outline the limited use zones for each area. In all cases no chlorine is detected at a depth greater than 3 m outside the influence of the jet stream from the outfall channel. During the chlorine studies a three-electrode continuous, on-line, automatic chlorine analyzer was developed. In a study of the effects of shock chlorination on fish eggs and fry, chlorine concentrations below 0.1 mg/liter (the maximum expected in discharges) have little effect on rainbow smelt eggs or larvae. Survival rates dropped raipdly as the temperature rises to 20 degrees C. (Cassar-PTT)

HALOGENATED ORGANIC STUDY AT SELECTED TENNESSEE VALLEY AUTHORITY FOSSIL-FUELED POWER PLANTS,
Tennessee Valley Authority, Chattanooga.
C. V. Seaman, L. O. Hill, B. W. Vignon, T. B. Stanford, and M. D. Hunter.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 373-382, 4 fig, 3 tab, 6 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, Organic compounds, *Cooling water, Trihalomethanes, Chloroform, Organic compounds, Tennessee Valley Authority, Powerplants.

Water samples were collected for organic analysis at the intake, outlet, and several points throughout the cooling systems of three Tennessee Valley Authority fossil-fueled steam plants. Chloroform was detected at each plant more than 90% of the time. Highest concentration detected was 18.0 mg/liter. Other volatile halogenated organics detected were bromodichloromethane, dibromochloromethane, 1,2-dichloroethane, trans-1,2-dichloroethylen, methylene chloride, and 1,1,1-trichloroethane. Semivolatile halogenated organics detected were 1-chloronaphthalene, 2-chlorophenol, and 1,2-dichlorobenzene. Comparison of inlet and outlet samples showed that outlet chloroform concentrations had a positive linear relationship with chlorine dose and a negative relationship with nitrogen species. The substrate was correlated significantly with chloroform concentration only when the effects of chlorine dosage were removed. Temperature was not apparently correlated with chloroform levels. However, combining the data across plants for the outlet location and removing the effects of other precursors showed a significant relationship. This suggested that temperature influences on chloroform concentrations were masked by effects of other variables. Likewise, the effects of chlorine demand and cooling water flow rate on chloroform production are masked. (Cassar-PTT)

ORGANOHALOGENS IN CHLORINATED COOLING WATERS DISCHARGED FROM NUCLEAR POWER STATIONS,
Battelle Pacific Northwest Labs., Richland, WA.
R. M. Bean, D. C. Mann, and D. A. Neitzel.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 383-390, 4 tab, 8 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, *Cooling water, Powerplants, Trihalomethanes, Phenols, Organic componds, Chlorinated hydrocarbons, Aromatic compounds, Nuclear powerplants.

Formation of organhalogens, particularly phenolic compounds, during biocide treatment of cooling water was studied at three nuclear powerplants. Chloroform concentrations in the discharges were 0.5 to 1.1 micrgrograms/liter; CHBrC12, 0.7-1.0 micrograms/liter; CHBr2C1, 0.3-0.9 micrograms/liter; and bromoform, 0.1-3.7 micrograms/liter. Concentrations of major phenolic compounds (in micrograms/liter) in chlorinated cooling waters were 2,4,6-trichlorophenol, 0.7; bromodichlorophenol, 0.5; dibromochlorophenol, 0.3; 2,4,6-tribromophenol, 0.4; and dibromodichlorophenol, 0.1. The highest total level of halogenated phenolic compounds at any station was 1.4 micrograms / liter. Conditions favoring the concentrations, longer chlorine residence time, higher bromine concentrations in intake water, low volatility, and presence of the biocide, which prevents biodegradation. In contrast, trihalomethanes tend to be released to the atmosphere in cooling towers. In once-through systems trihalomethanes were predominant.

ATMOSPHERIC EMISSIONS FROM ELECTRIC POWER PLANT COOLING SYSTEMS,
SRI International, Menlo Park, CA.
J. H. Smith, J. C. Harper, and B. C. DaRos.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 391-404, 8 fig, 3 tab, 6 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Chlorination, *Cooling water, Organic compounds, Trihalomethanes, Powerplants, Air pollution, Chlorinated hydrocarbons.

Concentrations of volatile halogentated compounds were determined in recirculation water systems and in the tower drift of three powerplants. Maximum concentrations (micrograms/liter) observed in up to 8 separate tests during chlorination of recirculation water were as follows: chloroform, 14.5; bromodichloromethane, 3.1; chlorodibromomethane, 3.3; bromoform, 2.9; trichloroethylene, 1.1; tetrachloroethylene, 0.1; and chloramines, 1.6. In general, chloroform concentrations in the tower basin were 20-30% lower than concentrations in the tower riser, suggesting that the towers strip some of the volatiles during one pass through the tower. Concentrations of volatiles (micrograms/liter) in the tower drift, using several different methods, were chloroform, 0.0002-0.81; trichloroethylene, trace to 0.48; tetrachloroethylene, trace to 1.73; p-dichlorobenzene, 0.07-0.27; and p-chlorotoluene, 0.42-1.45. The sampling techniques for the drift were not considered efficient. (Cassar-PTT)

HYDROGEN PEROXIDE - A REAL ALTERNATIVE TO CHLORINE IN WATER TREATMENT,
North Surrey Water Co., Staines (England).
E. R. Gardiner, N. J. Hobbs, and J. Jeffery.
IN: Water Chlorination: Environmental Impact and Health Effect; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 405-419, 8 fig, 5 tab, 16 ref.

Descriptors: *Fate of pollutants, *Water treatment, *Disinfection, *Hydrogen peroxide, Oxidation, Thames River, Trihalomethanes, Organic compounds, Chlorinated hydrocarbons.

Hydrogen peroxide and a low prechlorine dose reduce the trihalomethane (THM) formation at the prechlorination stage, but high postchlorination still yields high THM values. Hydrogen peroxide cannot be a complete replacement for prechlorination because it would not always achieve complete disinfection and would be difficult to monitor. Hydrogen peroxide with a low prechlorine dose achieves lower plate counts at 22 and 37 degrees C than chlorine alone. In the absence of free chlorine there is a lower value for THM formation in the presence of hydrogen peroxide. The coagulation treatment achieves an appreciable reduction in the potential THM formation. This work was carried out on actual river water samples that were variable. (Author)

Descriptors: *Fate of pollutants, *Pollutant ide fication, *Activated carbon, *Ozonation, Disin tion, Pilot plants, Adsorption, Water treatm Temperature effects, Gas chromatography, Org ic compounds.

Capillary gas chromatograms of 200-300 pe were compared using chi-square continge tables in a study of effluents from a granular a vated carbon water treatment pilot plant. Bef contacting the carbon, the water (from the D ware River at Philadelphia, Pa.) was treated clarification, rapid sand filtration, ozonation, ozone dissipation. The anlaytical methods w devised to determine the significant difference p= 0.05 of chromatograms of (1) influent vs. ef ent composite samples, (2) influent vs. effluents the activated carbon columns, (3) location of tr organics on columns, and (4) effects of differen in water temperature on trace organics remo The following conclusions were drawn. Replic carbon contactors had reproducible effluent chromatogram profiles. Influents to the colu were variable in weeks 3-5, after which they w homogeneous (weeks 6-13). Effluents for week 11.5 were homogeneous. Effluents were differ at the different temperatures. At week 9 core sa ples from the carbon columns showed differen between warm and cooled water. Chlorinated ganics were observed in the influent to the carb columns and on the surface of the carbon. chlorinated organics were found in the efflue during the 18-week study. (Cassar-PTT)

Descriptors: *Fate of pollutants, *Water treatme *Chlorination, *Activated carbon, *Organic co pounds, Adsorption, Morsang, France, Toxici Clarification.

Studies of the Morsang, France, water treatm plant from 1977 to 1980 concerned organic poll ants and the roles of prechlorination and granu activated carbon adsorption. The following co clusions were reached. (1) Prechlorination creased the intrinsic toxicity and hindered redu tion of the amount of extracted pollutants in t finished water. Overall activity of the extra (intrinsic toxicity times relative amount) was duced by 50% with prechlorination and 85% wi out prechlorination. (2) Activated carbon appli at low doses did not influence short-term toxic but seemed to reduce long-term toxicity. In cases it enhanced the reduction of the weight extract in the finished water. (3) Clarification (c agulation + flocculation + sedimentation + sa filtration) reduced the extract weight but increas its intrinsic toxicity. Clarification preferentially moved the less harmful substances. (Cassar-PT

and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 483-497, 3 fig, 9 tab, 6 ref. 80-034.

Descriptors: *Fate of pollutants, *Wastewater treatment, *Chlorination, Trihalomethanes, Chlorinated hydrocarbons, Brominated hydrocarbons, Organic compounds, Goulds-Perrine Treatment Plant, Virginia Key Treatment Plant, Florida.

The effects of chlorinating wastewater effluents was studied at several Miami, Florida, secondary treatment plants. Chloroform and brominated trihalomethanes were formed before and after the chlorination breakpoint. The concentration of individual trihalomethanes tended to follow the breakpoint curve; lower concentrations were found near the breakpoint. Bromides were present in wastewater from the Virginia Key plant, a result of sea water intrusion into the collection system. A clear trend in the rate of trihalomethane formation with respect to chlorine added was not obtained. (Cassar-PTT)

NONVOLATILE ORGANICS IN DISINFECTED WASTEWATER EFFLUENTS: CHEMICAL CHARACTERIZATION,
Oak Ridge National Lab., TN.
L. L. Jolley, R. B. Cumming, N. E. Lee, L. R. Lewis, and J. E. Thompson.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 499-523, 4 fig, 2 tab, 25 ref. EPA-IAG-D7-01027.

Descriptors: *Fate of pollutants, *Wastewater treatment, *Disinfection, *Organic compounds, Chlorination, Ozonation, Ultraviolet radiation, Toxicity, Mutagens, Chromatography, Oxidation.

Disinfection of secondary and tertiary effluents by chlorination destroyed some nonvolatile organic constituents and produced others in the majority of samples examined. Mutagenicity of certain fractions was similarly affected. Ozonation both destroyed and produced some nonvolatile organic compounds, including those showing mutagenic activity. Ultraviolet radiation had a definite but slight effect on nonvolatile organic constituents; it decreased mutagenicity in some effluents and increased it in others. Chemical composition and mutagenicity varied with plant and the date sampled. A total of 106 nonvolatile compounds were identified in the concentrates of control and disinfected effluents. The mutagenic fraction contained 0 constituents; the nonmutagenic fraction, 65. Twenty-nine constituents were found in both mutagenic and nonmutagenic fractions. No known mutagens were identified in the mutagenic fractions from undisinfected, chlorinated, ozonated, and ultraviolet-irradiated effluents. Phosphate identified in the chromatographic fractions was attributed to degradation during trimethylsilylation or anion exchange preparation. (Cassar-PTT)

IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 525-539, 5 fig, 5 tab, 31 ref. A-8-GA.

Descriptors: *Fate of pollutants, *Wastewater treatment, *Chlorination, *Leachates, *Landfills, Organic compounds, Trihalomethanes.

Leachate, obtained from a simulated landfill lysimeter, was chlorinated at doses up to 600 mg/liter chlorine. The landfill consisted of codisposed metal plating sludge and municipal solid waste. The leachate on day 697 after landfilling had a COD of 4791 mg/liter and BOD of 2150 mg/liter. The chlorine demand curve showed a sharp rise in chlorine residual at about 500 mg/liter chlorine dose. A leachate with initial COD of 4875 mg/liter showed increasing COD removal up to about 28% at the maximum chlorine dose of 600 mg/liter. Organisms were not fully removed (8000/ml remaining) even at the 400 mg/liter chlorine dose. Chlorination of the leachate produced a complex mixture of volatile haloorganic compounds, only one of which (methylene chloride) was found in the unchlorinated leachate. Among the products were 1-chloro-4-methylbenzene; chlorobenzene; 2-chloroethylbenzene; benzonitrile; trihalomethanes; halogenated ethanes, propanes, butanes, and heptanes; ketones; halogenated aromatics; and a number of unknown compounds. Until further data are collected, hypochlorous acid should be used cautiously as a disinfectant for landfill leachates. (Cassar-PTT)

GROUND-WATER MONITORING AT AN INDUSTRIAL WASTE DISPOSAL SITE IN PENNSYLVANIA,
N. L. Circhowicz, R. M. Cadwgan, and J. R. Ryan.
IN: Hazardous Waste Management for the 80's, Ann Arbor Science, Ann Arbor, MI, 1982. p 389-402, 8 fig.

Descriptors: *Waste disposal, *Groundwater pollution, *Geohydrology, Groundwater, Groundwater movement, Industrial wastes, Benzenes, Environment, On-site investigations, Water analysis.

A two-phase hydrogeologic investigation was carried out at a former industrial waste disposal site in Pennsylvania. Coal-coking sludge, agricultural chemical residue, and desulfurization waste are among the wastes disposed of in trenches at the 35 acre site, located on the tip of a river island. The purpose of Phase I of the study was to determine a preliminary estimate for the discharge rate of organic contaminants to the river via ground water. This was achieved by using data on the flow and quality of groundwater collected at 46 locations beneath, and adjacent to, the site. Benzene was found to be the dominant compound, showing a discharge rate of about 2 lb/day into the river from groundwater. Phase II was designed to better define the hydraulic gradient by continuously monitoring ground and river water levels. The hydraulic gradient of the water table was found to be typically toward the river, and over a two-month period, during low-flow conditions, averaged 0.0015. The direction of groundwater flow was toward the site for approximately six days during the same two-month period at a maximum gradient of 0.0058. (Halterman-PTT)

CASE HISTORIES OF GROUNDWATER ASSESSMENT,
Burgess and Niple Ltd., Columbus, OH.
J. A. Barker-Stonerock.
IN: Hazardous Waste Management for the 80's, Ann Arbor Science, Ann Arbor, I, 1982. p 403-420, 2 fig, 6 tab.

Descriptors: *Groundwater pollution, *Waste disposal, *Industrial wastes, *Landfills, Environment, On-site investigations, Groundwater movement, Water quality, Water sampling, Water analysis.

Case histories of groundwater assessment performed for a variety of purposes (assessment for landfill development, for abandoned landfill, and for surface impoundments) are presented. Groundwater assessments typically include the following: a review of existing water quality data to determine local groundwater quality; performance of test borings and laboratory testing on earth materials obtained during drilling; installation of monitoring wells at those locations where geologic and groundwater conditions indicate the best information may be obtained; estimation of rate of groundwater movement based on transmissivities; collection of water samples from completed monitor wells and analysis in laboratory for specified parameters; and preparation of final report to determine whether additional testing is required. The case histories presented illustrate the need for tailoring the study techniques to meet the individual requirements of each disposal site. (Halterman-PTT)

2,3,7,8-TETRACHLORODIBENZO-P-DOXIN AND 2,3,7,8-TETRACHLORODIBENZOFURAN RESIDUES IN GREAT LAKES COMMERCIAL AND SPORT FISH,
Health and Welfare Canada, Ottawa (Ontario).
J. J. Ryan, P-Y. Lau, J. C. Pilon, and D. Lewis.
IN: Chlorinated Dioxins and Dibenzofurans in the Total Environment, Butterworth Publishers, Boston, 1983. p 87-97, 1 fig, 4 tab, 10 ref.

Descriptors: *Chlorinated hydrocarbons, *Hydrocarbons, *Chlorinated dioxins, *Chlorinated dibenzofurans, Chemical Analysis, Gas chromatography, Chromatography, Mass spectrometry, Public health, Ecosystems, Ecology, *Great Lakes, *Fish.

Residues of 2,3,7,8-tetrachlorodibenzo-p-dioxin (tetra-CDD)and 2,3,7,8-tetrachlorodibenzofuran (tetra-CDF) were studied in commercial fish and sportfish in the Great Lakes, primarily Lake Ontario, during 1979 and 1980. For the samples with positive results, tetra-CDD ranged from 2.0 to 38.5 ppt, with catfish, eel and smelt having the highest levels. The levels of tera-CDF ranged from 3.2 to 200 ppt, with smelt, salmon and rainbow trout having the highest concentrations. Overall, 25% of the 62 fish sampled had concentrations of these compounds greater than 10 ppt. The highest concentrations were associated with high polychlorinated biphenyls and lipid content of the fish. (Halterman-PTT)

IN: Chlorinated Dioxins & Dibenzofurans in the Total Environment II, Butterworth Publishers, Boston, 1985. p 89-102, 3 fig, 4 tab, 28 ref.

Descriptors: *Chlorinated hydrocarbons, *Aquactic insects, *Hydrocarbons, *Biological magnification, Polychlorinated dibenzo-p-dioxins, Ecosystems, Aquatic environment, Insects, 1,3,6,8-tetrachlorodibenzo-p-dioxins, Ocatachlorodibenzo-p-dioxin.

The uptake, elimination and bioconcentration of 1,3,6,8-tetrachlorodibenzo-p-dioxin (1,3,6,8-TCDD) and octachlorodibenzo-p-dioxin (OCDD) by five species of aquatic insect were compared in the laboratory in two types of sediment. The purpose was to assess how bioavailability of polychlorinated dioxins (PCDD) in aquatic systems could be influenced by the physical properties of the chemicals, the characteristics of the physical environment, and the characteristics of the animals. Total radioactivity in each animal, and water concentrations of radioactive 1,3,6,8-TCDD abd OCDD were determined using liquid scintillation counting, and bioconcentration factors for each chemical and aquatic insect were calculated from 96 hr. exposure data. Bioconcentration of 1,3,6,8-TCDD and OCDD by aquatic insects was much less than predicted, possibly due to overestimation of the concentration present in water in a bioavailable form. OCDD was poorly accumulated by all animals studied (possibly due to strong sorption to sediment and to poor absroption due to steric factors). The differences in the bioconcentration factors among the various insects studied are discussed in relation to differences in feeding habits and metabolism. The results confirm that PCDD other than 2,3,7,8-TCDD can be mobilized by sediment-dwelling animals. (Halterman-PTT)

PART PER TRILLION RESIDUES OF 2,3,7,8-TETRACHLORODIBENZO-P-DIOXIN IN MICHIGAN FISH,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
S. W. Kaczmar, M. J. Zabik, and F. M. D'Itri.
IN: Chlorinated Dioxins & Dibenzofurans in the Total Environment II, Butterworth Publishers, Boston, 1985. p 103-124, 7 fig, 2 tab, 11 ref.

Descriptors: *Chlorinated hydrocarbons, *Fish, *Carp, *Sucker, *Hydrocarbons, Polychlorinated dibenzo-p-dioxin, 2,3,7,8-tetrachlorodibenzo-p-dioxin, Ecosystems, Aquatic environment, Michigan.

A study was carried out to determine whether 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) residues exist in selected Michigan fish samples in areas other than the previously-sampled Tittabawassee River watershed. Samples of carp (Cyprinus carpio) and sucker (Carostomus commersoni) were collected by electroshock at 31 sampling sites in the lower peninsula of Michigan. Samples were extracted, purified, then analyzed for 2,3,7,8-TCDD by gas chromatography-mass spectrometry (with a detection limit of 20 picograms). Detectable residues of 2,3,7,8-TCDD ranged from 17 to 586 ng/kg. Residues of 2,3,7,8-TCDD were detected in fish collected upstream to the chlrophenol manufacturing facility in Midland, and from other portions of the state in entirely different watersheds. The results suggest that low-level contamination of bottom-feeding fishes is relatively widespread in the industrialized portions of the state. (Halterman-PTT)

PCB'S: HUMAN AND ENVIRONMENTAL HAZARDS,
Butterworth Publishers, Boston. 1983. Edited by Frank M. D'Itri and Michael A. Kamrin. 443 p.

Descriptors: *Polychlorinated biphenyls, *Public health, *Social aspects, *Chemical analysis, Great Lakes, Political aspects, Water analysis, Monitoring, Toxicity, Fish.

Polychlorinated biphenyls (PCBs) have been used for industrial purposes for over 50 years. Research on the ecology and human health impact of these compounds has, however, been conducted only since 1966. This volume presents varied viewpoints on the hazard of these compounds, the latest research findings, and an overview of the steps that are being taken to solve PCB-related problems in the environment, with an emphasis on the Great Lakes region. The volume stresses five major aspects fo PCBs: (1) background, scientific, social and political information that is important to understand the PCB contamination problem; (2) the current state of the art with respect to chemical analysis and monitoring; (3) information on the metabolism, biotransformation, toxicology and persistence of PCBs; (4) effects of PCBs on human health; and (5) the roles of Federal and state agencies in the regulation of PCBs. (Halterman-PTT)

PCB PROBLEM: AN OVERVIEW,
Michigan State Univ., East Lansing.
J. E. Cantlon.
IN: PCB's: Human and Environmental Hazards, Butterworth Publishers, Boston, 1983. p 5-10.

Descriptors: *Polychlorinated biphenyls, *Public health, *Social aspects, *Chemical analysis, Great Lakes, Political aspects, Water analysis, Monitoring, Toxicity, Fish.

The global contamination of the environment with organics began with the burgeoning of industrial chemistry between World Wars I and II and picked up substantially both in diversity of hazardous materials and in the tonages that were released into the earth's hydrosphere, atmosphere, lithosphere, and biosphere after World War II. The halogentated hydrocarbons were manufactured for various kinds of industrial uses, including pesticides, inks, cutting oils, and heat exchange fluids. Among these hydrocarbons are the polychlorinated biphenyls (PCBs), which now appear in the tissues of most living organisms as well as in air, water, soils, and sediments over most of the earth. The Great Lakes have been a particularly interesting contamination area, with substantial food-chain concentrations of these highly fat-soluble compounds. While the manufacture of PCBs is now prohibited in the United States, the size of the environmental burden in waters, sediments, soils, disposal sites, and in deployed transformers and other containers of PCBs is very large, estimated to be 82 million kg. Several observations on these processes are offered. First, research results that bear on urgent decisions rarely have the luxury of science's normal process. Second, decision-makers are often subject to strong public pressures, predominantly from one side or the other, in arriving at their decisions. Third, on occasion, one organization holds both developmental and regulatory responsibilities. (Halterman-PTT)

health, *Social aspects, *Chemical analysis, Gr
Lakes, Political aspects, Water analysis, Monit
ing, Toxicity, Fish.

The ubiquitous distribution of residue-forming x
obiotic substances, particularly organochlori
compounds, including polychlorinated biphen
(PCBs) is rapidly becoming apparent. Widespre
dissemination is suggested by a variety of studies
areas presumably remote from the direct industr
and/or cultural influences attributable to man,
cluding melting snow in the Antarctic, mammals
the Artic, in the surface waters and atmosphe
above the Sargasso Sea, and inthe sediments
Siberian Lake Baikal. Although a number of the
compounds have been banned, or their use h
been severely restricted, they are still routine
reported in the Great Lakes basin. The identi
characteristics of PCBs which made them indust
ally desirable, also makes them persist and accum
late in the environment. They are resistant to ac
base reactions, hydrolysis, chemical oxidatio
photodegradation, thermal changes, and m
chemical agents. Furthermore, they bond tightly
particulate matter such as soils and sediments; th
have 8-15 year half-lives; they are extremely sol
ble in oils and fats, thus they tend to partition in
biologic tissue. Several reasons for the particul
susceptibility of the Great Lakes to PCBs a
listed, and an extensive literature review of data
PCBs observed in fish of the Great Lakes is pr
vided. Various aspects of human health hazar
pertaining to PCBs are discussed, including t
possiblity of PCBs persisting in the human popul
tion for as long as 5 to 8 generations into t
future. (Halterman-PTT)

Descriptors: *Polychlorinated biphenyls, *Gre
Lakes, *Distribution patterns, *Ecological distrib
tion, Distribution reservoirs, Chemical analys
Water analysis, Monitoring, Sediment-water inte
faces, Interfaces, Mud-water interfaces, Air-wat
interfaces.

Information on the polychlorinated biphen
(PCB) sources, sinks, and burdens in the Gre
Lakes is summarized. A mass balance model
described which provides an understanding of th
transport and distribution of PCBs in the lakes a
an estimate of the residence time that they rema
in the ecosystem, or in any compartment. Th
compartments include the atmosphere, hydros
pere, sediments, and lithosphere. The atmosphe
does not represent a significant reservoir of PC
in the Great Lakes, but appears to be a majo
pathway of input into the hydrosphere. Sediment
however, are the ultimate sink for PCBs in th
Great Lakes. The lower lakes, especially Erie an
Ontario, have the highest concentrations, rangin
from 50-60 ng/g. The Upper Great Lakes exhib
ranges of concentrations from 3 to 10 ng/g. Th
upper 0.5 cm of sediment appears to have th
highest concentrations within the lakes. The PC
burden for all the Great Lakes combined wa
estimated to be 417,000 kg in sediments, 25,000 k
87,000 kg in water, and 200 kg in the atmosphere
The principal sources of PCBs to the Great Lake
are atmospheric deposition, tributary input, an
municipal/industrial discharges. Considerable u
certainty still exists in estimating fluxes at air
water and sediment/water interfaces. (Halterma
PTT)

scriptors: *Polychlorinated biphenyls, *Public lth, *Social aspects, *Chemical analysis, Great es, Political aspects, Water analysis, Monitor-Toxicity, Fish, Michigan.

nsiderable controversy exists over which hod of preparation is best when fish are to be lyzed for contaminants such as polychlorinated henyls (PCBs). The state of Michigan's reason-on this issue is discussed, along with Michi-'s current fish contaminant monitoring pro-n. The objectives of the program are to pro-e information for assessing potential human ex-ure to contaminants from consumption of fish; letermine chronological trends in fish contami-ts; to identify new residues in fish: to communi-the results of these findings to appropriate ernment agencies; and to inform the public of lic health advisories. The inconsistencies within eral and state testing programs are discussed, the manner in which Michigan proposes to lve the question are outlined. The proposed includes the determination of a standard le portion which is specific for each species; the analysis of that portion of raw fish which ld most likely be eaten after cooking. The ous categories for testing include skin-on fillet such fish as perch, walleye, basses, crappie and ishes; skin-off fillet for catfish, pike, whitefish, trout; and headless, gutted common-sense ap-ch to fish contaminant sampling when the ctive is to determine amounts of consumable taminants present in fish. ilable data indicate that most fish species bio-form the lower chlorinated polychlorinated biphenyl (PCB) congeners at slower rates than mammals. Generally, the overall residue patterns in fish resemble the patterns found in the exposure source. Furthermore, the degree of bioaccumulation of PCBs in fish may be directly related to the fat content of the species in question, and that the major mechanism for reducing PCB concentrations in fish is by dilution by growth, rather than by true elimination of a portion of the total body burden. COLORADO RIVER SALINITY - THE USER'S PERSPECTIVE,
Colorado River Board of California, Los Angeles.
M. B. Holburt.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 13-22.

Descriptors: *Colorado River, *Saline water, *Salinity, Irrigation, Flood irrigation, Irrigation practices, Water requirements, Irrigation requirements, Water softening, Water supply, Water use, Water users.

The concern over the Colorado River's comparatively high salt concentration is discussed. Of particular interest is the major economic detriments to both agricultural and urban water users in the lower Basin states (Arizona, California, Nevada) and northwestern Mexico. Steps to control the salinity, begun in 1929 and continuing to the present, are outlined. Measures to reduce the impact of salinity on urban and agricultural areas are discussed. Methods include the use of water softeners by domestic and commercial users, use of corrosion-resistant plumbing, installation of drain pipes in farm fields to carry away the salt, and the lining of laterals with concrete to decrease seepage. (Halterman-PTT)

PROBLEM OF SALINITY AND ITS CONTROL, RIVER MURRAY, AUSTRALIA,
River Murray Commission, Canberra (Australia).
T. A. O'Brien.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 33-42, 4 fig, 1 tab.

Descriptors: *Saline water, *Salinity, Water requirements, Water supply, Water use, Water users, River Murray, *Australia, Monitoring, Water quality management.

The problems of salinity in south-eastern Australia, with emphasis on the River Murray, are described. There are three types of problems discussed: the salinity of water diverted from the river and applied to crops; the salinisation of irrigated land caused by the development of high water tables; and, the salinisation of dry land. The problems which could be common to rivers which form the border between states, or countries, are highlighted. The continued viability of the River Murray, and its importance to Australia, and the priority of government funding are discussed. (Halterman-PTT)

SOUTHWESTERN SALINITY SITUATION: THE ROCKIES TO THE MISSISSIPPI,
Army Engineer Div. Southwestern, Dallas, TX.
B. G. Rought.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 115-124, 2 fig, 4 ref.

Descriptors: *Saline water, *Salinity, Water requirements, Water users, Water use, Groundwater, Red River, Colorado River, Texas, Brazos River, Arkansas River, Pecos River, Desalination.

An overview of the salinity problem in the streams of the southwestern United States, from the Continental Divide to the Mississippi River, is presented. The quality of water in the mainstreams of a number of the river systems in this area is seriously degraded by salt emissions from major salt sources in the upper portion of their basins. Environmental and economic impacts of the salinity, including crop loss, increased municipal water treatment costs, and corrosion damage, are discussed. Potential solutions that are outlined include: importing fresh water, desalination, freshwater diversion, impoundment, and collection and disposal of brine. (Halterman-PTT)

NATURAL SALT POLLUTION CONTROL BRAZOS RIVER BASIN, TEXAS,
Army Engineer District, Fort Worth, TX.
J. A. McCrory.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 135-144, 6 fig, 3 ref.

Descriptors: *Saline water, *Salinity, *Desalination, Water requirements, Water users, Water use, Brazos River, Texas, Economic aspects.

Salt pollution from salt flats in the headwaters of the Brazos River has resulted in poor water quality in approximately 1500 kilometers of the main stem Brazos River from Stonewall County, Texas, to the Gulf of Mexico. The principal mineral pollutants considered in this study were chlorides, sulfates, and total dissolved solids. Various plans to control salinity in the Brazos River, including desalination, pipeline to the Gulf, and redistribution of existing water sources, are discussed. It appears

that desalination by impoundment evaporation techniques presents the most cost effective solution. (Halterman-PTT)

SALINITY BALANCE OF THE LOWER VIRGIN RIVER BASIN, NEVADA AND ARIZONA,
Montana Univ., Missoula. Dept. of Geology.
W. W. Woessner, M. D. Mifflin, R. H. French, A. Elzeftawy, and D. E. Zimmerman.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 145-156, 2 fig, 1 tab, 15 ref.

Descriptors: *Salinity, *Saline water, *Phreatophytes, Groundwater, Total dissolved solids, Virgin River, Nevada, Arizona, Monitoring, Water use, Water users, Water pollution sources.

This 12 month study developed additional hydrologic data for the development of salinity budgets in the Lower Virgin River Valley, Nevada and Arizona, a tributary of the Colorado River. Monthly stream gaging at six locations, groundwater monitoring at existing and new sites, water-quality sampling and soil sampling were included. Results indicate a complex hydrologic system with concentration, storage, and transport of salt occurring iin the study area. Water and salt budget analyses indicate a 36% net loss of water and a 34% net loss in salt for a 61 km reach of river. The majority of water loss is attributed to phreatophyte consumptive use. Salt concentration associated with phreatophyte comsumptive use exceeded consumptive concentration of salt by agriculture and direct evaporation by 2.6 times. Data indicate that phreatophyte areas play a major role in salt accumulation and storage by consumptively utilizing 2.1 to 3.6 m of water per year. TDS concentrations of 5,800 to 11,000 mg/l were measured in the shallow groundwater underlying phreatophyte areas. (Author)

GRAND VALLEY SALT PICK-UP CALCULATIONS,
Bureau of Reclamation, Grand Junction, CO.
R. R. Inman, D. C. Olson, and D. L. King.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 157-167, 2 fig, 4 tab, 2 ref.

Descriptors: *Salinity, Saline waters, Groundwater, Total dissolved solids, Monitoring, Water use, Grand Valley, *Colorado, *Colorado River, Water pollution sources.

The quantification of salt loading from the Grand Valley in western Colorado, based on an analysis of an inflow-outflow river budget, is presented. The Grand Valley contributes approximately 6 percent of the average salt loading to the Colorado River. An average salt pickup of 528 million kg/yr was determined through analysis of salt and water budgets over a 29 year period. A 95 percent confidence limit on the mean of + or - 84 million kg/yr was established. No significant trend in salt pickup was identified. The Colorado-Utah State Line gage was determined to be the most appropriate gage for estimating the Colorado River outflow. Outflows were adjusted so that the unaccounted flow was zero, which provided a better estimate of salt pickup. (Halterman-PTT)
W86-02278

IMPACT OF RESERVOIRS ON SEASONAL AND HISTORICAL SALINITY OF THE COLORADO RIVER,
Bureau of Reclamation, Salt Lake City, UT.
D. P. Trueman, and J. B. Miller.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 171-180, 4 fig, 3 tab, 9 ref.

Descriptors: *Saline water, *Salinity, Water requirements, Water users, Groundwater, *Colorado River, Desalination, Reservoirs, Multipurpose reservoirs.

The historical perspective of water resources development is presented and the impacts of reservoirs on salinity and the salinity control are evaluated. The increased development of reservoirs over the last several decades has resulted in an increased retention time of Colorado River water to the range of 4-6 years. This retention time has decreased both the seasonal and annual variability of salinity in the basin. Predicted increased discharges will effectively dilute the salinity in the lower basin. Future development, however, in the upper basin, will eventually reduce the flow through the system and cause increased salinity levels. (Halterman-PTT)

HISTORICAL TRENDS IN CONCENTRATION AND LOAD OF MAJOR IONS IN THE COLORADO RIVER SYSTEMS,
Bureau of Reclamation, Denver, CO.
D. K. Mueller, and C. D. Moody.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 181-192, 4 fig, 1 tab, 10 ref.

Descriptors: *Salinity, *Saline water, Model studies, *Colorado River, Water pollution, Solids, Discharge measurements.

A data base development procedure which allows maximum use of existing data to determine reasonable estimates of monthly mean solute concentrations, loads, and mass fractions is described. The data analysis included a regression of seasonal values. Interpretation of results of such analyses is based on several general observations, including: differences between regulated and unregulated sites are clearly seen; significant mean value differences are easier to identify than temporal trends in monthly data; trends are more easily identified for low flow periods, probably due to smaller variance in discharge data; changes in concentration, load and mass fraction are associated with river discharge; several dependent variables appear for solute changes; and no single dependent variable is clearly preferable for identification of changes or trends. EFFECT OF ASSUMPTIONS ON MODEL CALIBRATION AND PREDICTION,
Utah Water Research Lab., Logan.
E. K. Israelsen.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 195-201.

Descriptors: *Salinity, *Saline water, *Model studies, Agriculture, Groundwater, Mathematical models, Water pollution sources.

Background information on mathematical descriptions of processes and functions, computer algorithms, and model applications precede a discussion of the effects of assumptions on calibrations and predictive capability of models. Several alternative assumptions used in models concerning salinity are presented, and the subsequent variability in the results is demonstrated. The belief is stated that models will not indicate all the problems of fitting to the real system or any indication of feedback impacts. Furthermore, since models will not indicate all problems, they sometimes make predictions that are not correct, but the model links all the processes together so that the impacts of one process on another show up most of the time. Finally, although models are superior to single process calculations, they are not yet perfect and are subject to making errors as directed by the modeler. (Halterman-PTT)

LONGITUDINAL-VERTICAL HYDRODYNAMICS AND TRANSPORT WITH CHEMICAL EQUILIBRIA FOR LAKE POWELL AND LAKE MEAD,
Edinger (J.E.) Associates, Inc., Wayne, PA.
J. E. Edinger, E. M. Buchak, and D. H. Merritt.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston, 1984. p 213-222, 5 fig, 1 tab, 6 ref.

Descriptors: *Salinity, *Saline water, *Water p
lution sources, Model studies, Lake Powell, L
Mead, Colorado River, Carbonates, Imperial D
Reservoir operation.

The hydrodynamic features and numerical prop
ties of the LARM longitudinal and vertical hyd
dynamic and transport model are presented and
use in Lakes Powell and Mead are discussed. T
model produces extensive, detailed results incl
ing outflow conditions, evaporation rates and
tailed circulation patterns for Lake Powell. T
use of the model to construct carbonate chemis
in Lake Mead is also described. Data show t
there are gypsum sources along the reservoir t
can add calcium and sulfate to the system and a
the carbonate balance. Future uses of the model
the Bureau of Reclamation, for assessing lo
range impacts of Lake Mead and Lake Powell
the Colorado River system, are described. This
important because projections of future salin
increases and requirements for salinity control
presently based upon the assumption that the re
voirs exert no change on salinity other than c
centration by evaporation. (Halterman-PTT)

Furrow irrigation, Irrigation effects, Environm
tal effects, Irrigation engineering, Irrigation pr
tice.

Some specific aspects of the interaction and mixi
of groundwater from near surface saline strata, a
infiltration of water and solutes from irrigation
discussed. Subsurface transport in unconsolidat
strata is modeled and salt transport in consolidat
rocks is described. Preliminary calculations sugg
that diffusion from consolidated sediments m
contribute significant salinity to groundwater a
streams in the region. Little is known, howev
about the magnitude of diffusion coefficient, t
effective porosity, and the concentration contr
between unconsolidated strata, all of which cont
the magnitude of this salinity source. Future
search, including the exploration of the potential
diffusive salt loading, possibly a major factor
effective salinity control, is also discussed. (Halt
man-PTT)

**SALINITY CONTROL PROBLEMS ASSOCIA
ED WITH IRRIGATION IN SOUTH-WES
NEW SOUTH WALES, AUSTRALIA,**
Water Resources Commission of New Sou
Wales, Sydney (Australia).
A. van der Lelij, and S. E. Flint.
IN: Salinity in Watercourses and Reservoirs, Bu
terworth Publishers, Boston. 1984. p 265-274, 2 f
1 tab, 3 ref.

Descriptors: *Salinity, *Saline water, *Water po
lution sources, Groundwater, Irrigation, Irrigati
effects, Irrigation practices, Environmental effec
Economic aspects, Agricultural hydrology, Ag
culture.

In common with irrigation in many other semi-ar
regions, irrigation schemes on the Riverine Plain
south-west New South Wales have resulted in ris
in ground water levels which have created pro
lems of soil salinization and waterlogging. T
raised ground water levels can also lead to sa
intrusion into streams and impairment of wat
quality if they are not controlled. Subsurface drai
age presents problems of disposal of saline drainag
effluent without increasing the salinity of water
unacceptable levels for downstream users. A rang
of effluent management options are to be evaluate
to achieve the target salinity of 0.4 g/L at th
downstream end of the system. These includ

reuse of effluent upstream by discharge to, and dilution in, supply channels (limited scope because effluent salinity is often too high); dilution flows to reduce salinity downstream; diversion of the more saline winter drainage flows; on-farm retention of effluent during the irrigation season; disposal of some effluent in evaporation areas. CHARACTERISTICS, TRENDS AND SURFACE WATER QUALITY IMPLICATIONS OF SALINE TILE EFFLUENT,
D. B. Harker.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 325-334, 4 fig, 14 ref.

Descriptors: *Salinity, *Saline water, Irrigation, Irrigation effects, Irrigation practices, Environmental effects, Economic aspects, Agriculture, Agricultural hydrology, Alberta, Canada, Saskatchewan River Basin.

The possible negative impact of future saline tile effluent on river water quality within Alberta, Canada is being studied. A network of on-farm tile drainage outlets has been regularly monitored for the past six years - to establish effluent quantities, qualities and apparent trends. Based on general trends, tile drainage is not expected to severely impact on river water quality within the foreseeable future. Some short-term negative impact may occur during periods of extremely low river flow, however. Long-term chemical data from individual sites has annual cycles and multi-year trends otherwise masked by site averaging. Such information indicates that site-specific data could be critical to accurately project seasonal and long-term effluent impact on small receiving systems. (Author)

MEEKER DOME SALINITY INVESTIGATION,
CH2M Hill Central, Inc., Denver, CO.
C. F. Feast.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 359-365, 3 fig, 1 tab, 3 ref.

Descriptors: *Saline water, *Salinity, *Water pollution sources, *Water quality control, Groundwater, Water supply, Environmental effects, Well hydraulics, Economic aspects, White River, Colorado, Saline aquifers.

Following the drilling of exploratory oil wells, saline water rose through uncased bore holes and recharged an unsaturated aquifer. This led to a drastic increase in salt loading into the nearby White River. Prior to the drilling, the salt load of the White River was 4.5 million kg per year; after drilling, salt loading reached a high of 24 million kg per year. Immediately following cementing of the bore holes, water in the upper aquifer began falling rapidly. An 80% decrease in salt loading to the White River was observed within one year of plugging the wells. On the basis of the reduction in salt loading, the program has had a benefit-to-cost ratio of 5 to 1. This ratio is expected to increase if the saline flows continue to decrease. (Halterman-PTT)

PRICE/SAN RAFAEL RIVER BASINS SALINITY INVESTIGATION,
CH2M/Hill, Boise, ID.
D. A. Johnson, and J. A. Riley.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 407-416, 1 fig, 1 ref.

Descriptors: *Saline water, *Salinity, *Water pollution sources, *Water quality control, Model studies, Groundwater, Water supply, Irrigation, Monitoring, Water use, Cooling water.

Investigations into the agriculture-related contribution of salt to the San Rafael and Price River Basins are discussed. The study approach consisted of analysis of existing data, development of hypotheses concerning salt loading mechanisms, collection of field data to verify quantities and sources of salinity, and formulation and analysis of viable alternatives. Results of the investigations indicate that the most cost effective options include a combined plan for on-farm irrigation improvements and winter water system improvements; collecting and using the drainwater for cooling, using binary cooling tower technology; and, collecting and using the drainwater to develop tar sands. The need for additional research to confirm yields from irrigation drains, to demonstrate the use of saline wqter in binary cooling towers, to refine the use of saline waters in tar sand development, to develop mitigation plans, to refine on-farm efficiencies, and to understand groundwater interactions is stressed. STUDY OF SALINITY PRODUCTION FROM WILDLANDS OF PRICE RIVER BASIN, UTAH,
Unitex Corp., Salt Lake City, UT.
A. Lin.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 417-426, 4 fig, 3 tab, 6 ref. YA553-CTI-1064.

Descriptors: *Salinity, *Saline water, Shales, Gypsum, Watersheds, Ephemeral streams, Intermittent streams, Price River Basin, Utah.

Some essential results of a study of salinity production from wildlands are described. The major soluble mineral in Mancos shale is gypsum, with varying quantities of other sulfate minerals. For overland flows, solute pick-up increases as sediment concentration increases and as hill slope increases. Heavy solute pick-up in channels is a function of proximity to Mancos shale. Saline crust accumulations constitute a major source of salts to storm runoff and the estimated storm-related salt load contributed from wildlands ranged from 1% to 50%. The study confirms the importance of hillslope erosion in sediment and salinity production of the study area. (Halterman-PTT)

SALINITY CONTROL PROBLEMS: NON-AGRICULTURAL,
Utah State Univ., Logan. Dept. of Agricultural and Irrigation Engineering.
D. F. Peterson.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 583-592.

Descriptors: *Salinity, *Saline water, Groundwater, Water pollution, Seepage control, Seeps, Environmental effects, Groundwater movement.

A summary and critique of fifteen papers, concerning non-agricultural issues of salinity control, is presented. The topics of the papers fall into three categories: salinity sources and problems, salinity control programs, and salinity control project mitigation. 'Salinity sources' covers the Danube Basin and the southwestern United States. 'Salinity control programs' focuses on the Colorado River, Smokey Hill River in Kansas, the Red and Arkansas Rivers, and the general problems of 'produced' water in Kansas. Salinity control project mitigation focuses on a variety of problems in Arizona, California, Montana, and Australia. Technology, economic analyses, and institutionalization, as they relate to salinity control, are discussed. (Halterman-PTT)

CRITIQUE - SALINITY CONTROL PROBLEMS: AGRICULTURAL,
Science and Education Administration, Fort Collins, CO. Agricultural Research.
M. E. Jensen.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 597-608, 2 tab.

Descriptors: *Salinity, *Saline water, Groundwater, Water pollution, Seepage control, Seeps, Environmental effects, Groundwater movement, Agriculture, Agriculture watersheds.

Several papers pertaining to salinity control are reviewed and critiqued. Areas such as upstream vs. downstream users, long-term indicators of emerging problems, barriers to implementing control measures, the role of irrigated agriculture, water consumption by flood plain vegetation, and salt removal are reviewed. Possible distribution of river basin water costs is explored, and specific examples are provided for illustration of the concept. (Halterman-PTT)

SOURCE MOVEMENT AND EFFECTS OF NITROGEN AND PHOSPHORUS IN THE HEADWATERS OF HOP BROOK, MARLBOROUGH, MASSACHUSETTS,
Geological Survey, Boston, MA. Water Resources Div.
J. C. Briggs, and W. D. Silvey.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4017, 1984. 5 p, 3 fig, 17 tab, 25 ref.

Descriptors: *Water quality, *Ponds, *Nutrients, Eutrophication, Algal growth, Nitrogen phosphorus, Hager Pond, Grist Millpond, Carding Millpond, Hop Brook, *Massachusetts.

The headwaters of Hop Brook near Marlborough, Massachusetts, contain a series of three in-line ponds--Hager Pond, Brist Millpond, and Carding Millpond--which receive over half of their surface-water inflow as effluent from the Marlborough Easterly Wastewater Treatment Plant. These ponds have a history of summer algal blooms and fish kills. Water entering these ponds contains quantities of nitrogen and phosphorus far higher than the levels known to promote excessive growth of aquatic vegetation. As the water moves

through the three ponds, nitrogen levels decrease. Although some nitrogen is lost to the atmosphere by denitrification, the bulk of the nitrogen probably is retained in the pond sediments. There is a net decrease in phosphorus in the water leaving Carding Millpond compared to the water entering Hager Pond. However, during most sampling periods, the phosphorus concentration of water leaving Carding Millpond is still above the level known to cause excessive growth of aquatic vegetation in lakes. During certain summer periods, there appears to be release of some phosphorus from the sediments in Carding and Grist Millponds. No improvement in water quality of the three ponds can be expected until the concentrations of nutrients entering Hager Pond are reduced to levels that will not support excessive growth of aquatic vegetation. QUALITY AND QUANTITY OF URBAN RUNOFF AND ATMOSPHERIC DEPOSITION IN URBAN AREAS OF SALT LAKE COUNTY, UTAH, 1980-1981,
Geological Survey, Salt Lake City, UT. Water Resources Div.
R. C. Christensen, D. W. Stephens, G. E. Pyper, H. F. McCormack, and J. F. Weigel.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4011, 1984. 223 p, 11 fig, 36 tab, 22 ref.

Descriptors: *Urban hydrology, *Utah, *Urban runoff, *Organic pollutants, Sediment composition, Salt Lake County, *Atmospheric deposition, Storm characteristics, Salt Lake County.

Water of good quality from mountain streams is degraded as it moves through urban areas to the Jordan River in Salt Lake County, Utah. The impact of urban runoff and atmospheric deposition on the quality of water in those streams and in storm conduits and canals functioning as storm drains was evaluated using data collected during 1980-81. Atmospheric-wetfall loads for an average storm were as much as 10 pounds per acre for total solids, but the dissolved trace metals were generally present in insignificant quantities. Wetfall-deposition loads generally were greater than storm-runoff loads, indicating that a large quantity of the wetfall load remained as soil deposits. Acid rain fell in more than one-half of the storms sampled, most commonly in September and October. Dustfall concentrations reflected the composition of local soils, particularly with regard to iron, manganese, and chromium; but concentrations of cadmium, copper, lead, zinc, and chloride were considerably enriched. Monthly loads of dryfall solids reached a maximum of 62 pounds per acre in the Little Cottonwood Creek urban basin, but were of the same magnitude as total storm loads for a heavy rainfall. Urban runoff represented about 38 percent of the discharge in three canals. The water in the canals was poorer in quality than the water in the mountain streams. The impact of the canal discharges to the streams is slight, however, owing to their 'relatively small amounts.' Concentrations of sediment, suspended solids, suspended trace metals, phosphorus, and oxygen-demanding substances were much greater during storm runoff than under base-flow conditions. This report contains data for basin and storm characteristics and water-quality information for atmospheric deposition and urban runoff. (USGS)

NUTRIENT AND DETRITUS TRANSPORT IN THE APALACHICOLA RIVER, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
H. D. Mattraw, and J. F. Elder.
Available from Dist Branch, USGS 604 S. Pickett St Alexandria, VA 22304. USGS Water-Supply Paper 2196-C, 1984. 62 p, 27 fig, 32 tab, 62 ref.

Descriptors: *Nutrients, *Detritus, *Floodplains, Flood discharge, Wetlands, Hydrologic budget, Organic matter, Carbon, Nitrogen, Phosphorus, Water quality, Baseline studies, Swamps, *Florida, *Wetlands, *Apalachicola River, *Nutrient transport, *River quality assessment.

The Apalachicola River in northwest Florida flows 172 kilometers from Jim Woodruff Dam to Apalachicola Bay on the Gulf of Mexico. Fifteen percent of the Apalachicola basin is occupied by a bottom-land hardwood floodplain that is relatively undeveloped. The dense floodplain forest produces approximately 800 metric tons per square kilometer of litter fall annually. Spring floods of March and April 1980 carried 35,000 tons of the decaying litter fall (detritus) into Apalachicola Bay. The estuary is predominantly a detrial-based food-web ecosystem which produces important commercial quantities of oyster, shrimp, blue crab, and various species of fish. Two hundred fourteen thousand metric tons of organic carbon were transported into the bay during the 1-year study period, June 1979 to June 1980. Nitrogen transport during the same period was 21.5 x 10 (to the third) tons and phosphorus was 1.7 x 10 (to the third) tons. The Apalachicola River floodplain contribution to the annual transport of carbon, nitrogen, and phosphorus was 34,200 tons, 668 tons, and 197 tons, respectively. Sixteen percent of the organic carbon is derived from less than 1 percent of the Apalachicola-Chattahoochee-Flint River basin. (USGS)

LITERATURE REVIEW OF SURFACE-WATER QUALITY IN THE CUYAHOGA VALLEY NATIONAL RECREATION AREA, OHIO,
Geological Survey, Columbus, OH. Water Resources Div.
C. J. O. Childress.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Open-File Report 84-619, 1984. 30 p, 6 fig, 2 tab, 31 ref.

Descriptors: Streams, *Water quality, Literature review, Dissolved oxygen, Base flow, Storm runoff, Bed load, *Ohio, *Cuyahoga River basin, Cuyahoga Valley National Recreation Area.

The Cuyahoga Valley National Recreation Area in Ohio encompasses about 23 miles of the middle reach of the Cuyahoga River and parts of four major tributaries--Furnace Run, Brandywine Creek, Chippewa Creek, and Tinkers Creek. Water quality in this reach does not meet Ohio water-quality standards for dissolved oxygen, fecal bacteria, ammonia, and lead. Point sources and nonpoint sources of effluent contribute contaminants. On the basis of a review of scientific and technical literature, National Park Service management goals, and water-quality data collected recently by the U.S. Geological Survey, three subject areas in need of study have been identified: (1) the dissolved oxygen regime, (2) chemical quality of base flow and (3) quality of stormwater runoff. (USGS)

TIME OF TRAVEL, WATER QUALITY, AND BED-MATERIAL QUALITY FOR THE CUYAHOGA RIVER WITHIN THE CUYAH VALLEY NATIONAL RECREATION A OHIO,
Geological Survey, Columbus, OH. Water sources Div.
C. J. O. Childress.
Available from OFSS, USGS, Box 25425, wood, CO 80225. USGS Open-File Repor 4065, 1985. 49 p, 14 fig, 6 tab, 11 ref.

Descriptors: *Water quality, Biochemical ox demand, Dissolved oxygen, Coliforms, Strepto cus, *Traveltime, Dye releases, Trace elem *Bottom sediments, *Streams, *Path of pollu *Ohio, *Cuyahoga River, Cuyahoga Valley tional Recreation Area.

Three studies were conducted in the Cuya Valley National Recreation by the U. S. Geo cal Survey to (1) establish the relationship bet time of travel and discharge through the reach of the Cuyahoga River, (2) charact water quality of the Cuyahoga River within park over a 24-hour period, and (3) deter general areas where the streambed might be taminated by trace metals. Time of Travel bet Botzum and Independence is described by equation T = 46.9-0.038Q, where T = tim hours, and Q = discharge at Independenc cubic feet per second. On the main stem o Cuyahoga River, dissolved-oxygen saturation highest and ultimate carbonaceous biochem oxygen demand was lowest on the upstream downstream ends of the reach. Dissolved-ox saturation was more than 80 percent in all tributaries except Furnace Run, Brandy Creek, and Langes Run. The number of coliform counts per 100 milliliters of sample high throughout the study area and ranged fro to 1,200,000. Concentrations of all metals and metals investigated by means of analysis of material were not anomalously high. (USGS)

SELECTED HYDROLOGIC DATA FOR T SOUTH PLATTE RIVER THROUGH DENV COLORADO,
Geological Survey, Lakewood, CO. Water sources Div.
N. E. Spahr, S. R. Blakely, and S. E. Hammond
Available from OFSS, USGS, Box 25425, L wood, Co 80225. USGS Open-File Report 84- 1985. 225 p, 5 fig, 24 tab.

Descriptors: *Waste assimilative capacity, Rea tion, Traveltime, Water quality, *South Pl River, Denver, *Colorado, Water pollu sources, Urban hydrology.

The U.S. Geological Survey, in cooperation the cities of Littleton and Englewood, Color studied the effects of the discharge of treated e ent from the Bi-City Waste Water Treatment P on low-flow conditions of the South Platte Ri An 18-mile reach of the South Platte River, be ning below Chatfield Reservoir, through Denver metropolitan area was studied. Chatf Reservoir was used to regulate the flow of South Platte River on four occasions between tober 1982 and January 1984. Each flow-regula period was used to achieve a stable, low-f condition. Data collection during low flow lowed for the study of waste assimilation du both warm- and cold-water conditions. W quality, streamflow, channel geometry, travelti mixing-zone, reaeration, and benthic-oxy demand data were collected at selected instre tributary, and effluent sites. This report pres data collected during four periods of low f along the South Platte River. (USGS)
W86-02391

EFFECTS OF STORMWATER RUNOFF ON URBAN LAKE, LAKE ELLYN AT GL ELLYN, ILLINOIS,
Geological Survey, Urbana, IL. Water Resour Div.
R. G. Striegl.
Available from OFSS, USGS, Box 25425, La wood, CO 80225. USGS Open-File Report 84-6 1985. 19 p, 7 fig, 9 tab, 20 ref.

Descriptors: *Urban hydrology, *Storm runoff, *Detention storage, Trace metals, Sediment control, Limnology, Trap efficiency, *Runoff detention, *Illinois, Lake Ellyn.

Detention of urban runoff was observed to have physical, chemical, and biological effects on a small lake located near Chicago, Illinois. Accumulated bottom sediments reduce lake storage and have comparatively high concentrations of metals and organic compounds. Concentrations of many constituents dissolved in the lake water are seasonally cyclic, with annual concentration peaks occurring during the winter. Maintenance of desirable benthic invertebrate and fish communities, and development of undesirable phytoplankton blooms appear to be inhibited by sediments deposited on the lake bottom and suspended in the lake water. (USGS)
W86-02392

ALDICARB-PESTICIDE CONTAMINATION OF GROUND WATER IN EASTERN SUFFOLK COUNTY, LONG ISLAND, NEW YORK,
Geological Survey, Syosset, NY. Water Resources Div.
J. Soren, and W. G. Stelz.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4251, 1984. 34 p, 7 fig, 4 tab, 26 ref.

Descriptors: *Water pollution sources, Groundwater quality, Geologic formations, Aquifers, *Hydrogeology, *Groundwater, Water pollution, *Pesticides, *New York, *Groundwater pollution, *Long Island, Eastern Suffolk County, *Aldicarb pesticide.

Aldicarb, a toxic oxime-carbamate pesticide that was believed incapable of reaching ground water, was used in potato-farming areas of eastern Suffolk County, New York during 1975-80. In 1979, aldicarb was found in substantial concentrations in ground water throughout the area. The New York State Department of Health set a limit of 7 micrograms per liter for aldicarb in drinking water. Extensive ground-water sampling into 1980 showed widespread contamination ranging from small amounts to as much as 515 micrograms per liter. In 1980, the U.S. Environmental Protection Agency banned the use of aldicarb on Long Island at the manufacturer's request. A 1982 sampling study found aldicarb to have penetrated to about 70 feet below the water table in concentrations ranging from below detection limit to 239 micrograms per liter. Despite reputed toxicity, no instance of aldicarb poisoning on Long Island has been documented. The excessive aldicarb concentrations in the ground water of eastern Long Island may persist for decades; the duration has not been precisely determined and remains under investigation. (USGS)

VOLATILE TRACE-ELEMENT CONCENTRATIONS IN SNOWMELT CONTRIBUTIONS TO STREAMS MONITORED BY HYDROLOGIC BENCH MARK NETWORK STATIONS IN THE CONTERMINOUS UNITED STATES WHERE AVERAGE ANNUAL SNOWFALL EXCEEDS 12 INCHES,
Geological Survey, Bismarck, ND. Water Resources Div.
J. L. Houghton, and L. Schimke.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 85-4104, 1985. 19 p, 5 fig, 4 tab, 28 ref.

Descriptors: *Snowmelt, *Stream pollution, Trace metals, *Chemistry of precipitation, United States, *Hydrologic Benchmark Network.

Water-quality data collected for more than 10 years at 35 Hydrologic Bench-Mark Network stream stations in the snowbelt of the conterminous United States where average annual snowfall exceeds 12 inches were evaluated for evidence of trace-element enrichments during initial springtime snowmelt. Data for at least 1 initial snowmelt period are available at only 11 of these stations. Snowmelt enrichments in the concentrations of volatile trace elements, such as mercury, molybdenum, and selenium, ranged from 0 to 100 percent at stations in North Dakota and Montana. Enrichments in volatile trace-element concentrations were accompanied by pH decreases; and, therefore, pH decreases during snowmelt at other sites may indicate enrichment of volatile trace elements. Although enrichments of some of these trace elements exceeded 90 times their mean concentrations during nonsnowmelt periods, concentrations did not exceed drinking-water standards. However, concentrations of mercury in laboratory-simulated snowmelt exceeded drinking-water standards. (USGS)
W86-02397

DISTRIBUTION AND TRANSPORT OF TRACE SUBSTANCES IN THE SCHUYLKILL RIVER BASIN FROM BERNE TO PHILADELPHIA, PENNSYLVANIA,
Geological Survey, Harrisburg, PA. Water Resources Div.
J. K. Stamer, T. H. Yorke, and G. L. Pederson.
Available from Distribution Branch, USGS, 604 S. Pickett St., Alexandria, VA 22304. USGS Water-Supply Paper 2256-A, 1985. 45 p, 33 fig, 12 tab, 40 ref.

Descriptors: *Bottom sediments, *Trace elements, *Pesticide residues, *Probability distribution, Water quality standards, *Pennsylvania, *Schuylkill River, *Water pollution sources.

From October 1978 to March 1981, the U.S. Geological Survey assessed quality of Schuylkill River from Berne to the Fairmount Dam at Philadelphia, Pennsylvania. The assessment focused on the distribution and transport of trace metals and organic substances. In general, concentrations of trace metals and organic trace substances in the bottom sediments exceeded the background concentrations in the study area, and were greater in the main stem of the Schuylkill River than in its tributaries. Concentrations of most trace metals were lowest at Berne and highest in the urban-industrial Reading area. Concentrations generally decreased from Reading downstream to Philadelphia. Concentrations of chlordane, DDT and its metabolites, and dieldrin generally increased from Berne to Philadelphia, paralleling the increase in urban land use from Berne to Philadelphia. Transport of trace metals in the Schuylkill River is closely related to suspended-sediment transport. About 71 percent of the average annual transport of trace metals is in particular material. The frequency at which concentrations of copper, lead, and zinc in the Schuylkill River at Manayunk at Philadelphia are estimated to exceed domestic water-supply criteria of the U.S. Environmental Protection Agency is less than 1 percent of the time. 5C. Effects Of Pollution

RELATIVE SENSITIVITY OF SEABIRD POPULATIONS IN ALASKA TO OIL POLLUTION,
Bureau of Land Management, Anchorage, AK. Alaska Outer Continental Shelf Office.
D. J. Hansen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB83-142091, Price codes: A02 in paper copy, A01 in microfiche. Technical Paper No3, August 1981, 15 p, 2 fig, 4 tab, 13 ref, append.

Descriptors: *Oil pollution, *Waterfowl, *Water birds, *Alaska, *Sensitivity analysis, Water pollution effects, Birds, Arctic Polar regions, Ecological effects, Oil spills.

The oil vulnerability index (OVI) developed by King and Sanger (1979) was used to identify sensitive species of birds in Alaska that could be affected by oil pollution. Many of the most common seabirds in Alaska and species endemic to the Bering Sea or the North Pacific are highly sensitive (a score of 70 or greater OVI) to oil pollution. The southern Bering, northern Bering, and the Chukchi Sea regions have over 80% of their major seabird colony populations rated highly sensitive. Within the Gulf of Alaska, the northwestern region and southwestern region have substantially larger populations of sensitive birds than the northeastern region. In general offshore oil and gas development in the Bering Sea poses a greater risk to seabird and waterfowl populations than would oil development in the Arctic Ocean or in the Gulf of Alaska. Oil and gas activities within the major foraging habitat of vulnerable populations in the Bering Sea represents the greatest concern to seabirds in Alaska. For most endemic waterfowl populations, the Yukon-Kuskokwim Delta represents the most important or critical habitat in Alaska. (Geiger-PTT)

TYPES OF POTENTIAL EFFECTS OF OFFSHORE OIL AND GAS DEVELOPMENT ON MARINE MAMMALS AND ENDANGERED SPECIES OF NORTHERN BERING, CHUKCHI, AND BEAUFORT SEAS,
Bureau of Land Management, Anchorage, AK. Alaska Outer Continental Shelf Office.
C. J. Cowles, D. J. Hansen, and J. D. Hubbard.
Available from the National Technical Information Service, Springfield, VA 22161 as PB83-146142, Price codes: A02 in paper copy, A01 in microfiche. Technical Paper No9, December 1981. 23 p, 75 ref.

Descriptors: *Mammals, *Marine animals, *Offshore platforms, *Oil pollution, *Oil spills, Seals, Whales, Arctic, Polar regions, Marine plants, Ocean dumping, Water pollution effects, Natural gas, Water birds.

Direct effects of spilled oil to non-endangered marine mammals would vary depending on population density, physiological status, season, meteorological conditions, spill characteristics, duration of exposure and other factors. For many of the species occurring in Alaskan arctic areas, long-term, chronic, and direct or indirect effects associated with oil and gas development are of greater concern than the probability of widespread direct affects on seal populations. One possible result of low-level or chronic pollution would be to contribute to physiological stress on marine populations which may be at or near carrying capacity. Indirect effects of oil pollution on marine mammals would be those associated with changes in availability or suitability of various food sources or essential habitat factors. Mammalian species such as bearded seal or walrus may be most likely to show tropic-related effects in a specific locale since they rely on relatively sedentary benthic food sources. Shock waves and noise disturbance associated with offshore oil and gas development may alter the behavior of marine mammals. Other factors which may directly affect marine mammals include shoreline alteration, facility siting, dredging and filling, and secondary development. Potential factors affecting endangered cetaceans include direct and indirect oil and gas pollution effects, noise and disturbance effects and other factors such as marine disposal of drilling muds, formation waters, and cooling waters, shoreline alterations, and airborne noise. ECOLOGICAL EFFECTS OF ACID PRECIPITATION,
Sigma Research, Inc., Richland, WA.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-903148, Price codes: A05 in paper copy, A01 in microfiche. Proceedings of a Workshop held March 4-6, 1981, Atlanta, Georgia. EPRI-EA-2273, February 1982. 98 p, append. EPRI-WA 80-180.

Descriptors: *Acid rain, *Ecological effects, *Water pollution effects, *Air pollution, *Conferences, Acidic water, Ecosystems, Environmental

effects, Vegetation effects, Aquatic animals, Lime, Forest watersheds, Crop production, Fate of pollutants, Symposium.

The three-day workshop on Ecological Effects of Acid Precipitation was convened in Atlanta, Georgia, on March 4, 1981. This undertaking, sponsored jointly by the US Environmental Protection Agency (EPA) and the Electric Power Research Institute (EPRI), constituted the initial step in a series of planned, interactive efforts to enhance cooperation between individuals and agencies involved in acid precipitation research. The intent of the co-sponsors was to provide a forum for exchange concerning research directions being pursued by industry and government and to explore the need for coordination and integration of US studies - especially the ecosystem effects studies of EPRI and EPA. Approximately 85 active researchers, managers, and planners attended the workshop. These invited participants were drawn primarily from the fields of aquatic and terrestrial ecosystem research and included representatives from Canada, Norway, Sweden, and the United Kingdom. The workshop included presentations of program descriptions, a limited set of technical research efforts, and summaries of non-US programs in ecosystems studies. It culminated in a series of working group sessions that examined issues in aquatic systems, agricultural systems, natural terrestrial systems, and an overview of effects. Each working group considered outstanding research issues and identified critical areas where coordination and integration of research efforts could accelerate our understanding of the impacts of acid precipitation. A. W. Hoadley.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 17-36, 1 tab, 72 ref.

Descriptors: *Water treatment, *Drinking water, *Public health aspects, Potable water, Trace metals, Metals, Water analysis, Bacterial analysis, Salmonella, Shigella, Carcinogens.

Engineers involved in water supply must understand potential threats to the health of consumers, standards of quality with which to judge safety, and techniques for evaluating quality. Towards this end, several aspects of public health, related to water supplies are discussed. The most common waterborne infectious disease has been acute gastrointestinal illness. The waterborne bacterial pathogens Salmonella, Shigella, Escherichia coli, Yersinia enterocolitica, and Pseudomonas aeruginosa have all been implicated in major outbreaks of disease. The most common of the waterborne protozoan pathogens is Giardia lamblia. While outbreaks of waterborne Entamoeba hisolytica were reported in the United States prior to 1970, none have been reported since then. Viral diseases, such as hepatitis, are very serious matters with regard to water treatment, because very small numbers of viral particles appear to be capable of causing infection in man. The importance of trace metals in cardiovascular diseases and psychiatric disorders is discussed. Finally, the relationship between known carcinogens in drinking water supplies, and the incidence of various types of cancer is discussed. It appears that asbestos fibers, polynuclear aromatic hydrocarbons, chloroform, and carbon tetrachloride contamination in water has been related to cancers of the urinary organs and the gastrointestinal tract. ECONOMIC IMPACTS OF PCB REGULATION IN FOOD FISH,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
D. R. Talhelm.
IN: PCB's: Human and Environmental Hazards, Butterworth Publishers, Boston, 1983. p 409-422, 1 fig, 3 tab, 3 ref.

Descriptors: *Polychlorinated biphenyls, *Public health, *Social aspects, *Chemical analysis, Great Lakes, Political aspects, Water analysis, Monitoring, Toxicity, Fish.

Following the Food and Drug Administration's (FDA) lowering of the allowable polychlorinated biphenyl (PCB) levels from 5 to 2 mg/kg in the edible portion of fish and shellfish, the National Fisheries Institute claimed that a $7-10 million per year food loss would result. A hearing addressing this issue was presented with data (from the National Marine Fisheries Service) on a large variety of commerically important fish, including whitefish, trout, carp, catfish, striped bass, bluefish, mackerel and lobster. The largest food loss would result from the lobster industry, estimated at $10 million. The total loss for all fish was estimated to be $14 million. The National Fisheries Institute, however, estimated the food loss to be $24 million. The hearing examiner found that the loss would be $13.5 million. However, several mistakes were apparently made, which resulted in errors within several fish categories. However, the total loss figures were similar to the original estimates of the FDA. 5D. Waste Treatment Processes

ACID MINE DRAINAGE: CONTROL A ABATEMENT RESEARCH,
Bureau of Mines, Pittsburgh, PA. Pittsburgh search Center.
A. G. Kim, B. S. Heisey, R. L. Kleinmann, and Deul.
Available from the National Technical Informat Service, Springfield, VA 22161 as PB83-140 Price codes: A02 in paper copy, A01 in microfi Report IC/8905, 1982, 22 p, 16 fig, 3 tab, 28

Descriptors: *Wastewater treatment, *Water q ity control, *Acid mine drainage, *Coal mi Pyrite, Oxidation, Sulfuric acid, Thiobacillus rooxidans, Drainage, Neutralization, Lime, Li stone, Sludge, Surfactants, Mine wastes, S banks.

Acid drainage from coal mines and refuse p results from oxidation of pyrite to form sulfi acid. As pH decreases, the pyrite-oxidizing activ of Thiobacillus ferrooxidans is promoted, furt increasing the pH. The Bureau of Mines is c ducting research to mitigate the impact of acid streams and aquifers. Mine sealing by flooding exclude oxygen, eliminating pyrite oxidati However, long-term sealing has often failed mines above drainage. Research on mine seal includes studies on more efficient and less exp sive seals, pneumatic stowing of limestone as a outcrop barrier stability, relief wells, and oxy diffusion in coal refuse piles. Developments treatment of acid mine drainage before discha into streams include a limestone neutralizat process which produces a denser sludge, the ef of activated carbon catalyst on particles, an low-cost treatment system for small acid-conta nated streams using artificial sphagnum moss limestone rubble. Methods for at-source contro acid mine drainage currently under investigat are bactericides to control limestone treatment freshly exposed pyrite, placement of sumps pumping systems, and control of groundwater tering mines. FEEDWATER CLEANUP FOR COMBIN ELECTROLYSIS CATALYTIC EXCHANGE,
Monsanto Research Corp., Miamisburg, OH.
J. E. Lentz, J. Sienkiewics, and R. E. Ellis.
Available from the National Technical Informat Service, Springfield, VA 22161 as DE82-019 Price codes: A02 in paper copy, A01 in microfi Report MMM-2970; UC-70, Final Report. July 1982. 13 p, 1 fig, 7 tab. DE-AC04-76-DP000

Descriptors: *Wastewater treatment, *Orga compounds, *Oily water, Ion exchange, Activa carbon, Adsorption, Electrolysis catalytic change system, *Tritium, *Radioactive was Tritiated water.

A treatment process was developed for remov oil from tritiated wastewater from the combi electrolysis catalytic exchange system at Mound Facility, Miamisburg, Ohio. The pilot sc process comprised skimming of the oily layer, tering to remove particulates, absorbing solu organic material in three traps filled with mate such as activated carbon, filtering to rem carbon particles, and removing inorganic conta nates with ion exchange resin. If the treated wa was not satisfactory for feeding into the combi electrolysis catalytic exchange system, it was re cled for further treatment. Some inconsistencies organic removal were possibly a result of chann ing in the carbon beds. High flow rates tended produce better organic removal. Materials tested the traps were Witco activated carbons, Gra 940, 950, and 965, and three types of Amberlite exchange resins, XAD-7, XAD-4, and IRA-9 The ion exchange resins actually added orga matter to the water being treated. Of the activa carbons, Witco 950 was most effective in reduci organic levels. (Cassar-PTT)

PHYSICOCHEMICAL TREATMENT METHODS FOR OIL SHALE WASTEWATER: EVALUATION AS AIDS TO BIOOXIDATION,
California Univ., Berkeley. Lawrence Berkeley Lab.
B. M. Jones, R. H. Sakaji, and C. G. Daughton.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-020295, Price codes: A02 in paper copy, A01 in microfiche. Report LBL-14666, July 1982. 17 p, 8 fig, 43 ref. DE-AC03-76SF00098.

Descriptors: *Biological wastewater treatment, *Physicochemical treatment, *Biological oxidation, *Oxidation, *Oil waste, Activated carbon, Organic carbon, Wastewater treatment, Ozonation, Wastewater oxidation, Ultraviolet radiation, Mineralization, Sorption.

Biological treatment is usually effective for the mineralization of only one-half of the organic carbon present in retort waters. Several physicochemical treatment methods including sorption and chemical oxidation were evaluated for their ability to complement or enhance biooxidation. The use of spent shale or powdered activated carbon (PAC) effected preferential sorption of the less polar, biorefractory organic compounds from retort water. However, the concurrent application of these sorbents with biooxidation did no promote a synergistic removal. The construction and application of a pilot-scale adiabatic stainless steel and beaded-glass steam stripper for removal of ammonia, hydrogen sulfide and carbon dioxide from oil shale process wastewaters is discussed; emphasis is placed on the benefits steam stripping would accord biooxidation. Ultraviolet radiation had no significant effect on the biorefractory organic solutes in retort water. Extensive ozonation structurally altered 14% of the recalcitrant dissolved organic carbon. Ozonation mediated by ultraviolet radiation had a synergistic effect. Potent chemical oxidation was incapable of effecting sufficient structural alteration of the biorefractory compounds to encourage renewed biooxidation. This implies that oxidative enzyme systems may also be incapable of promoting further alteration or mineralization of these recalcitrant solutes. (Geiger-PTT)

TECHNICAL GUIDE ON BIOLOGICAL NUTRIENT REMOVAL: THE PHOREDOX PROCESS,
National Inst. for Water Research, Pretoria (South Africa).
M. J. N. Simpkins, and A. Gerber.
1981. 20 p, 13 fig, 5 tab, 27 ref.

Descriptors: *Wastewater treatment, *Nutrient removal, Phoredox process, Phosphates, Nitrates, Nitrogen, Denitrification, Biological wastewater treatment, Design criteria, Pilot plants, Anaerobic digestion, Aerobic digestion, Clarifiers, Sludge.

This guide, intended as a help in design and operation of the Phoredox process, was developed from data obtained at a Pretoria pilot plant operating on domestic sewage. The Phoredox process is a five-stage process designed to remove nitrogen and phosphorus by biological means. These stages are as follows: anaerobic--denitrification and phosphate release; primary anoxic--additional denitrification of nitrates; primary aeration--oxidation of biodegradable nitrogen and carbonaceous matter; secondary anoxic and aerated--denitrification of nitrates formed in the previous stage; and clarifier--separation of phosphate-containing solids. A pilot plant experience is detailed. Phosphate removal efficiencies were 78% and 68% for settled sewage feed and raw sewage feed, respectively. Effluent nitrate and phosphate concentrations regularly were higher on weekends, coinciding with the drop in COD. Several critical points in design and operation are emphasized. Aeration must be uniform so that no anaerobic zones exist. The anoxic retention time can be increased during periods of low COD. Excess oxygen uptake in the aeration gases or from the atmosphere should be avoided prior to entering the anoxic phases. (Cassar-PTT)

AQUACULTURE SYSTEMS FOR WASTEWATER TREATMENT: SEMINAR PROCEEDINGS AND ENGINEERING ASSESSMENT,
Environmental Protection Agency, Washington, DC. Municipal Construction Div.
Proceedings held September 11-12, 1979, University of California-Davis. Report EPA 430/9-80-006, September 1979, MCD-67. 485 p.

Descriptors: *Wastewater treatment, *Aquaculture, *Aquatic plants, *Fish, Bilogical wastewater treatment, Tertiary wastewater treatment, Lagoons, Wastewater lagoons, Wetlands, Water hyacinth, Nutrient removal.

Papers on wastewater aquaculture are divided into several categories: overview, use of wetlands (creation of new wetlands, use of existing wetlands, and use of cypress domes), aquatic plant systems (mainly water hyacinth), combined systems with aquatic pants and fish or shellfish, and economic and energy aspects. (Cassar-PTT)
W86-02047

ENGINEERING ASSESSMENT OF AQUACULTURE SYSTEMS FOR WASTEWATER TREATMENT: AN OVERVIEW,
Cold Regions Research and Engineering Lab., Hanover, NH.
S. Reed, R. Bastian, and W. Jewell.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 1-12.

Descriptors: *Wastewater treatment, *Aquaculture, Wetlands, Aquatic plants, Fish, Ponds, Stabilization ponds, Water hyacinth, Biological wastewater treatment.

Aquaculture technology was evaluated for its suitability for municipal wastewater treatment. Artificially constructed wetlands show promise of general application. Water hyacinth systems are ready for routine use in municipal wastewater treatment in climates where the plants grow naturally. The possibility of using more cold-tolerant plants should be investigated. In combined systems finfish effectively participate in the treatment process, removing suspended solids in final polishing. Combined systems cannot presently be optimized for both protein/biomass production and wastewater treatment. Although information on operating fish culture units in stabilization ponds is available, routine design for the purpose of wastewater treatment is not yet possible. (Cassar-PTT)
W86-02048

FEDERAL ROLE AND INTEREST BY EPA'S CONSTRUCTION GRANTS PROGRAM IN AQUACULTURE SYSTEMS FOR MUNICIPAL WASTEWATER TREATMENT,
Environmental Protection Agency, Washington, DC.
J. N. Smith, and R. K. Bastian.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 29-33, 6 ref.

Descriptors: *Wastewater treatment, *Aquaculture, Federal jurisdiction, Construction, Grants Program, Innovative/alternative technology.

The subject of water pollution control and wastewater treatment can be seen as a problem of biology rather than simply one of engineering. The scientific basis for treating and the reuse/recycling of wastewater should give greater emphasis to ecology and the management of natural biological systems. Neither the technological problems of designing biological systems nor the political and institutional constraints facing their implementation should prevent the increased future use of aquaculture systems for wastewater treatment. Where these systems can be made to work they should offer effective solutions to the need for cost-effective, environmentally acceptable, and energy efficient wastewater treatment and recycle/reuse practices. In order to assist in encouraging greater use of these aquaculture systems for wastewater treatment, we need to make sure that the results of past and ongoing research efforts are effectively applied to innovative/alternative technology projects funded through the EPA Construction Grants Program. USE OF AQUATIC PLANTS AND ANIMALS FOR THE TREATMENT OF WASTEWATER: AN OVERVIEW,
California Univ., Davis. Dept. of Civil Engineering.
G. Tchobanoglous, R. Stowell, R. Ludwig, J. Colt, and A. Knight.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 35-55, 3 fig, 6 tab, 16 ref.

Descriptors: *Wastewater treatment, *Aquaculture, Aquatic plants, Fish, Biological wastewater treatment, Algae, Zooplankton, Shellfish, Crustaceans, Design criteria.

Aquatic systems employing plants and animals have been proposed as alternatives to conventional wastewater treatment systems. The fundamental difference between conventional and aquatic systems is that in the former, wastewater is treated rapidly in highly managed environments, whereas in the latter, treatment occurs at a comparatively slow rate in essentially unmanaged natural environments. The consequences of this difference are (1) conventional systems require more construction and mechanization but less land than aquatic systems, and (2) conventional processes are subject to greater operational control and less environmental influence than aquatic processes. The major stimulus for further research into the fundamentals, design, and management of aquatic systems is the potential for reducing the construction and operation and maintenance costs for wastewater treatment. The general concept involved in the design and use of aquatic systems are presented and the implications are discussed in this overview. (Author)

WETLANDS CREATION FOR HABITAT AND TREATMENT - AT MT. VIEW SANITARY DISTRICT, CA.,
Mountain View Sanitary District, Martinez, CA.
F. C. Demgen.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 61-73, 4 fig, 2 tab, 12 ref.

Descriptors: *Wastewater treatment, *Aquaculture, *Wetlands, Aquatic habitats, Nutrient removal, Nitrogen, Phosphorus, Mt. View, California, Habitats, Aquatic plants, Vegetation, Algae, Animals, Invertebrates.

The Mt. View (California) Sanitary District's wetlands creation project on low lying reclaimed tidal lands, uses treated sewage effluent as a freshwater source. The wetlands system covers 20.3 acres and consists of five interconnected areas with tributary edge habitat. Detention time is 5 days at design capacity. The ecosystem has been balanced and healthy. The habitat supports 72 species of plants, 21 species of animals, 90 species of birds, and 34 species of aquatic invertebrates. Natural predators control mosquito breeding. No avian botulism or odors are evident because good water circulation is maintained. Redwood bark floats have been added to provide supplementary habitat for aquatic invertebrates. Water quality parameters are as follows: (1) dissolved oxygen, 1 mg/liter to supersaturation, normally above 5 mg/liter, (2) BOD, varies seasonally, usually less than loading levels and consists of algae and other organisms, (3) suspended solids, usually reduced in winter but not in summer, (4) nitrates, >90% removal consistently, (5) ammonia and organic nitrogen, about 60% removal, and (6) phosphates, 37-53% removal.

W86-02051

CYPRESS WETLANDS FOR TERTIARY TREATMENT,
Boyle Engineering Corp., Orlando, FL.
W. R. Fritz, and S. C. Helle.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 75-81, 7 fig. ENV76-23276.

Descriptors: *Wastewater treatment, *Wetlands, *Cypress, Florida, Nutrient removal, Biological wastewater treatment, Tertiary wastewater treatment, Swamps.

Cypress domes (shallow, saucer-shaped depressions receiving drainage water) are technically feasible as a tertiary wastewater treatment method. Three concepts are possible. (1) The natural dome needs little modification. Treated wastewater, applied to the center of the dome percolates to the groundwater, losing contaminants on the way. (2) The isolated dome needs an earth dike around the perimeter to keep out storm runoff and retain wastewater. (3) The flow through system operates as a sheet flow through the cypress strand with purification en route to a downstream waterway. Tests show 98% total nitrogen removal and 97% total phosphorus removal. Cypress strands have economic advantages over the other methods because they can process a larger volume than the domes. Bacterial and viral contamination of the groundwater do not appear to be a problem if effluent is sufficiently chlorinated and if all short-circuits to the groundwater are avoided. Areas suitable for municipal treatment must have the following: sufficient capacity, low failure rates, flood and natural disaster resistance, adequate sunshine, electricity for pumps, and a sufficient safety factor. (Cassar-PTT)

EFFECTIVENESS OF A WETLAND IN EASTERN MASSACHUSETTS IN IMPROVEMENT OF MUNICIPAL WASTEWATER,
IEP, Inc., Wayland, MA.
D. A. Yonika.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 91-100, 4 fig, 3 tab.

Descriptors: *Wastewater treatment, *Wetlands, Biological wastewater treatment, Tertiary wastewater treatment, Concord, Massachusetts, Marshes, Nutrient removal, Nitrogen removal, Phosphorus removal.

The Concord, Massachusetts, sewage treatment plant discharges secondary effluent to a 48-acre deep marsh. The wetlands functions as two units: a 6-acre shallow marsh/shrub swamp and the deep marsh. Retention time is 57 days. Final discharge is into the Concord River. Concentrations of substances (in mg/liter) in effluent and in discharge to the river, respectively, were as follows: ammonia N, 8.0 and 0.15; nitrate-N, 3.1 and 0.47; nitrite nitrogen, 0.019 and 0.010; Kjeldahl N, 10.0 and 0.77; total phosphorus, 2.1 and 0.17; orthophosphate, 1.6 and 0.10; and BOD, 38.2 and 2.3. Average annual removal efficiencies ranged from 20% for nitrate-N to 67% for BOD. Nitrite-N was released from the system. Removal efficiency varied seasonally. The BOD uptake was higher on an annual basis in the shallow area (20.8 pounds per acre per day). The shallow area was also more efficient than the deep marsh in removing phosphorus. Ammonia-N removal rates were higher in the deep marsh; nitrate-N removal rates were higher in the shallow area. (Cassar-PTT)

WETLAND TERTIARY TREATMENT AT HOUGHTON LAKE, MICHIGAN,
Michigan Univ., Ann Arbor. Dept. of Chemical Engineering.
R. H. Kadlec.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 101-139, 13 fig, 11 tab, 43 ref.

Descriptors: *Wastewater treatment, *Wetlands, Biological wastewater treatment, Nutrient removal, Nitrogen removal, Phosphorus removal, Tertiary wastewater treatment, Environmental effects, Aquatic habitats, Habitats, Plants, Animals, Houghton, Michigan.

Secondary wastewater effluent was discharged to a 7 sq km peatland near Houghton, Michigan, for five consecutive summers. All nitrogen and phosphorus was stored or removed within a 5-acre area at a discharge rate of 100,000 gal/day and within a 50-acre area at a discharge rate of 1 million gal/day. Chloride and other inactive dissolved ions moved through the wetland with very little change. pH, higher in the discharge, dropped rapidly to background levels (slightly acid) as the discharge traveled across the wetland. Conductivity also dropped to background levels. Suspended solids were deposited close to the discharge area. Erosion, plant mortality, odor, and effects on animals and birds were nonexistent. The only visual effects were greener plants and slightly deeper water near the discharge. Coliforms and viruses appeared at equal levels in the discharge and the wetland. (Cassar-PTT)
W86-02055

ENGINEERING, ENERGY AND EFFECTIVENESS FEATURES OF MICHIGAN WETLAND TERTIARY WASTEWATER TREATMENT SYSTEMS,
Williams and Works, Grand Rapids, MI.
T. C. Williams, and J. C. Sutherland.
IN: Acquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979, MCD-67. p 141-173, 12 fig, 3 tab, 15 ref.

Descriptors: *Wastewater treatment, *Wetlands, Biological wastewater treatment, Irrigation, Wastewater irrigation, Tertiary wastewater treatment, Houghton, Vermontville, Michigan, Phosphorus removal, Nitrogen removal, Spray irrigation, Energy, Capital costs.

Two markedly different Michigan wetlands are receiving pond stabilized secondary treated nonchlorinated wastewater. Both operations result in removal of 98%-100% of phosphorus through contact with reactive soils. At Vermontville, flood irrigation fields (11.5 acres) overgrown with volunteer wetland vegetation (mainly cattail) treat and dispose of wastewater princpally by slow seepage (4 inches-week) through phosphorus-absorbing clayey-silty glacial till. Occasional uncontrolled runoff of wetland surface waters releases phosphorus, BOD, and uspended solids in concentratio slightly above permitted limits. Seepage wetlan offer potential advantages compared to upla spray irrigation for small communities. Savings 25% or greater on capital plus land costs can b expected for flow below 0.1 MGD average flow Field maintenance may not be needed, and irrig tion energy costs need be no higher than those f surface irrigation of uplands. At Houghton Lak natural state-owned wetlands (600 acres) treat an dispose of wastewater by overland flow across reactive peat substrate. Construction and maint nance in 1978 involved negligible ecologic impact. Construction was done in the dorma months between March and June. The wetlan transmission and irrigation pipelines are strappe to a wooden walkway suspended 2.5 ft above th wetland on pole pilings anchored in clay. The co of the wetland wastewater distribution system w $21.00/ft (1979 dollars). Irrigation electric energy costs were approximately $7.21 in 197 The wetland capital and land costs represent sa ings of approximately $1 million compared upland irrigation. (Author)

Descriptors: *Wastewater treatment, *Aquacu ture, *Aquatic plants, Lagoons, Wastewater goons, Water hyacinth, Duckweed, Phenol, Bi logical wastewater treatment, Seconda wastewater.

A general background of the research findings the National Aeronautics and Space Administr tion's Vascular Aquatic Plant Program usi higher plants such as the water hyacinth (Eichho nia crassipes) and duckweed (Lemna sp. and Spir dela sp.) to treat domestic wastewater is presente New data on a small two-cell lagoon system usi only duckweed is included. Further laboratory e periments were conducted to correlate BOD r moval with known wet masses of water hyacinth The data from these experiments with domest wastewater indicates that an average total BO removal rate of 4.0 mg BOD/gram wet weig could be achieved with a seven day retention tim When a phenol solution is substituted for t wastewater, the average total BOD removal is 3 mg BOD/gram wet weight in seven days. Th data along with the results of the previous fie experiments, is used to develop design criteria f small domestic wastewater treatment systems ser icing a maximum of 3000 people. The criteria f these systems addresses the problems of BOD r duction, total suspended solids reduction, od control, and sludge accumulation. (Author)

DEVELOPMENT OF HYACINT WASTEWATER TREATMENT SYSTEMS I TEXAS,
Texas State Dept. of Health, Austin.
R. Dinges.
IN: Aquaculture Systems for Wastewater Trea ment: Seminar Proceedings and Engineering A sessment, September 11-12, 1979, University California-Davis. EPA 430/9-80-006, Septemb 1979. MCD-67. p 193-231, 16 fig, 4 tab, 15 ref, append.

Descriptors: *Wastewater treatment, *Aquacu ture, *Aquatic plants, *Water hyacinth, Biologic wastewater treatment, Nutrient removal, Nitroge removal, Phosphorus removal, Algae, Texas, Hy draulic loading.

Plant-scale wastewater treatment by water hy cinth culture has been implemented in seven Texas locations. Some general conclusions can b

drawn from these experiences. Sufficient design data is presently available for constructing hyacinth tretment facilities in warm climates. However, optimal design is necessary to minimize areas and costs for using this treatment system in greenhouses in temperate climates. The most critical consideration in culture basin design is hydraulic loading. A triangle-shaped basin is an ideal shape; two of these may be combined to form a rectangle for better land use. The primary pollutant removal mechanism in hyacinth treatment is removal of suspended particulates. Since hyacinth harvesting disrupts treatment, multiple culture basins should be used for alternate operation. Nitrogen management is a key factor in utilizing hyacinths for wastewater treatment or for biomass production. Stablilization ponds can be designed for effective nitrogen reduction. Hyacinth removes most remaining nitrogen in pond effluent, especially that in organic form such as algae. Effluent from a hyacinth treatment system can produce effluents with less than 10 mg/liter BOD and total suspended solids. (Cassar-PTT)

WATER HYACINTH WASTEWATER TREATMENT SYSTEM AT WALT DISNEY WORLD,
Reedy Creek Utilities Co., Inc., Lake Buena Vista, FL.
P. Kruzic.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis, EPA 430/9-80-006, September 1979. MCD-67, p 257-271, 2 fig, 3 tab, 5 ref.

Descriptors: *Wastewater treatment, *Aquatic plants, Water hyacinth, Biological wastewater treatment, Walt Disney World, Florida.

A water hyacinth wastewater treatment system is being tested at Walt Disney World, Florida. Consisting of three 1/4-acre channels with piping, hydraulic control devices, and pumping equipment, it is designed to handle flows up to 200,000 gpd with a probable minimum of 50,000 gpd. The complete-mix mobile harvesting system includes a front end loader, conveyor-chopper, and forage wagon. Although most components of the project are operating as planned, some problems have developed. For example, in using a backhoe to seed the hyacinths into the channels, much grass and dollar-weed was also brought in. The unwanted plant species had to be removed. In treating primary effluent, dissolved oxygen concentrations are very low. Floating sludge and fly larvae exist in ponds which once supported a mosquitofish population. Monitoring of the system continues. (Cassar-PTT)

UTILIZATION OF WATER HYACINTHS FOR CONTROL OF NUTRIENTS IN DOMESTIC WASTEWATER -- LAKELAND, FLORIDA,
Dawkins and Associates, Inc., Orlando, FL.
E. A. Stewart.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 273-293, 8 fig, 1 tab, 8 ref.

Descriptors: *Wastewater treatment, *Aquaculture, *Aquatic plants, Fish, Water hyacinth, Lakeland, Florida, Nutrient removal, Nitrogen removal, Phosphorus removal, Invertebrates, Mosquitoes, Biological wastewater treatment, Lagoons, Wastewater lagoons, Ponds.

A large (up to 13 mgd) water hyacinth treatment demonstration project in Lakeland, Florida, was based on nutrient removal requirements of 1.5 mg/liter total N and 0.4 mg/liter total P. The system consisted of three one-acre lagoons in series. Plant health and chlorophyll content declined from Pond 1 to Pond 3, with iron the limiting nutrient. Oxygen levels in the water were adequate to above saturated, rarely falling below 2 mg/liter in Pond 1, which was expected to have the lowest levels. pH changed from neutral to slightly alkaline. BOD and suspended solids were reduced somewhat. Nitrogen and phosphorus uptake were greater than expected for the crop density of 99 metric tons/ha. Water color and turbidity were noticeably reduced throughout the system. Dissolved solids decreased due to selective uptake of certain ions such as ferrous ion, calcium, and chloride. Coliform reduction was dramatic. The biological nature changed throughout the system. In Pond 1 hyacinths were large; macroinvertebrates were restricted to chironomid larvae, mosquito larvae, and a snail; two fish species were surviving well. In Pond 2 the hyacinths were smaller and suffered from chlorosis; the invertebrate and fish populations were diverse and numerous. In Pond 3 hyacinths were very chloratic; fish and invertebrates were even more diverse than in Pond 2. Designing the system for plant growth kinetics in cool weather allows for a safety margin. SOME ECOLOGICAL LIMITS TO THE USE OF ALTERNATIVE SYSTEMS FOR WASTEWATER MANAGEMENT,
Michigan State Univ., East Lansing. Inst. of Water Research.
D. L. King.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 299-307, 14 ref.

Descriptors: *Wastewater treatment, *Aquaculture, *Lagoons, Ponds, Biological wastewater treatment, Algae, Cyanophyta, Fish, Nitrogen removal, Phosphorus removal, Standards, Effluent standards, Ecosystems.

Biological, chemical, and physical factors interact to place limitations on the use of natural ecosystems for wastewater treatment. An understanding of these limits allows better design of treatment systems to fit individual environmental and wastewater conditions. At the Michigan State University Water Quality Management Facility expansion of the lagoon system was based on effluent tests which showed excellent BOD and coliform removal. However, BOD was underestimated by the 5-day test. Algae, spilling into the effluent, did not decompose within 5 days but became part of the BOD load further downstream. When suspended solid limits were placed on lagoon effluents, lagoon systems required revision to meet standards. Other natural factors to consider are seasonal variations and the lack of a natural mechanism to remove phosphorus on a long-term basis. The nutrient balance in wastewater is not suitable for pond biota, favoring growth of undesirable blue-green algae. The presence of fish which eat zooplankton also favors eventual dominance of blue-green algae and supression of macrophytes. Another limiting factor, toxic to fish, is the ammonia and high pH common in wastewater ponds. The strict water quality standards with respect to pathogens and other contaminants discourages use of wastewater aquaculture food products at this time. (Cassar-PTT)

UTILIZATION OF SILVER AND BIGHEAD CARP FOR WATER IMPROVEMENT,
Arkansas Game and Fish Commission, Lonoke.
S. Henderson.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979, MCD-67. p 309-350, 5 append.

Descriptors: *Wastewater treatment, *Aquaculture, *Fish, Benton, Arkansas, Water quality, Silver carp, Bighead carp, Carp, Lagoons, Wastewater lagoons, Biological wastewater treatment.

Filter feeding fish, the silver and bighead carp, were stocked in an existing lagoon treatment system in 1975-76 for a preliminary evaluation of the effect of the fish on water quality and the potential of this nutrient source for fish production. In a full-scale 6-cell, 24-acre facility at Benton, Arkansas, BOD removal was 96.4% and suspended solids removal was 86% during the first 8 months of the study. Detailed water quality monitoring results are given in the appendixes. With three months remaining in the growing season, the standing crop of fish in the four ponds containing fish was >22,777 kg, a total average production of 3344 kg/ha. Fish tissue and water samples were regularly analyzed for particular pathogens, metals, and pesticides. Only Staphylococcus bacteria, copper and mercury levels were above detection limits. Using the fish as fish meal would yield a gross return of $430-$575/ha/year; for direct human consumption, $3600-$4525/ha. (Cassar-PTT)

TREATED SEWAGE EFFLUENT AS A NUTRIENT SOURCE FOR MARINE POLYCULTURE,
Woods Hole Oceanographic Institution, MA.
J. H. Ryther.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979, MCD-67. p 351-375, 7 fig, 5 tab, 5 ref.

Descriptors: *Wastewater treatment, *Aquaculture, Fish, Shellfish, Oysters, Clams, Flounder, Lobsters, Biological wastewater treatment, Tertiary wastewater treatment, Seaweed, Algae, Nitrogren removal, Nutrients.

A biological tertiary sewage treatment-marine aquaculture system was developed and studied at the Woods Hole Oceanographic Institution. Secondary sewage effluent mixed with sea water was used to grow phytoplankton in continuous flow-through cultures. This product was fed to several varieties of shellfish in stacked trays. Uneaten food and wastes from the shellfish supported small invertebrates, in turn eaten by lobster and flounder stocked in the shellfish areas. Effluent from the shellfish tanks was passed through red algae grown in suspended culture to reduce nutrients further. Total nitrogen removal efficiency was 93.6%. (Cassar-PTT)

Descriptors: *Wastewater treatment, *Aquaculture, *Anaerobic digestion, *Aquatic plants, Energy, Biological wastewater treatment, Digestion, Methane, Biomass, Ponds.

Aquatic biomass produced in wastewater treatment ponds can be an energy source. The high moisture, high nutrient, and low lignocellulose content of most aquatic plants makes them ideal substrates for anaerobic digestion. Although little specific data is available, this reaction can be expected to proceed without significant difficulties and at rates comparable to those seen with sewage sludge. Studies are being conducted on two-phase reactors which separate the acid and methane bacterial cultures. Other technologies are gas recovery from landfills or anaerobic ponds and the anaerobic filter process using an expanded bed reactor. The possible fuel outputs for a secondary wastewater aquaculture system of 15 mgd are 6.0 MBTU/MG with energy conservation of 6.0 MBTU/MG. A tertiary treatment system would produce about 37.5 MBTU/MG of net fuel output and have an energy conservation potential of 13.5 MBTU/MG. (Cassar-PTT)

OVERVIEW OF THE LEGAL, POLITICAL, AND SOCIAL IMPLICATIONS OF WASTEWATER TREATMENT THROUGH AQUACULTURE,
Denver Research Inst., CO.
L. C. Lohman.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 459-474, 13 ref.

Descriptors: *Wastewater treatment, *Water law, *Aquaculture, *Political aspects, *Social aspects, Legal aspects, Public participation, California, Regulations, Federal jurisdiction, State jurisdiction, Legislation, Standards, Water rights, Water reuse, Attitudes.

The legal, political, and social elements involved in full-scale aquaculture for wastewater treatment are highlighted. Emphasis is on California, where several aquaculture projects are under development. On the Federal level many statutes, regulations, and agencies are concerned with wastewater aquaculture. The National Water Pollution Control Act and its amendments exert the most direct control over wastewater discharges. State law regarding water quality is largely derived from Federal law. The power of particular interest to proponents of wastewater aquaculture is the state control over rights to use water and obligations to protect all water users. Wastewater aquaculture can change the quantity and quality of water for downstream users. States generally exercise control over all aspects of wastewater treatment with special concern about effects on public health. Legal and political elements are closely entwined. Influences and policies affect decisions on new wastewater facilities. Many conflicts are possible. Society reacts to proposed projects as different interest groups, from individuals to large organizations. Acceptance of wastewater aquaculture by the public is easier if effluent meets standards and no nuisances are created. (Cassar-PTT)

ECONOMICS OF AQUATIC TREATMENT SYSTEMS,
Metcalf and Eddy, Inc., Sacramento, CA.
R. W. Crites.
IN: Aquaculture Systems for Wastewater Treatment: Seminar Proceedings and Engineering Assessment, September 11-12, 1979, University of California-Davis. EPA 430/9-80-006, September 1979. MCD-67. p 475-485, 11 tab, 20 ref.

Descriptors: *Wastewater treatment, *Aquaculture, *Aquatic plants, *Fish, Biological wastewater treatment, Tertiary wastewater treatment, Lagoons, Wastewater lagoons, Wetlands, Water hyacinth, Nutrient removal, Advanced wastewater treatment, Oxidation ponds, Economic aspects, Wetlands, Energy, Land disposal.

Aquatic treatment systems, although still in the development stage in most areas, offer low-cost, low-energy solutions for wastewater treatment. For advanced secondary treatment (BOD and suspended solids, 10 mg/liter; no nutrient removal), combinations of oxidation ponds with water hyacinths or wetlands are cost effective compared at 1 mgd with land treatment or conventional treatment. For the lowest cost flowsheet examined, the land cost can reach $115,000/acre before the conventional activated sludge system becomes economically competitive. For advanced wastewater treatment (nitrogen, 3 mg/liter; phosphorus, 1 mg/liter), aquatic systems alone have not been developed technically to achieve the same standards. The aquatic processes can, however, be integrated with land treatment and oxidation ponds to achieve this high quality of effluent. In the cases studied, the combined equatic-land treatment systems were less expensive than land or conventional treatment at 1 and 10 mgd. As aquatic systems become further developed and demonstrated, the costs will become more firmly established. In addition, the economic benefits (such as from compost, fertilizer, soil conditioners, or biogas) may offset some of the costs of wastewater treatment in the future. (Author)

monia, Food processing industry, Industrial wastes, Biological wastewater treatment, Suspended solids, Biological oxygen demand, Activated sludge, Oxidation.

In January 1981, the first Total Barrier Oxidation Ditch activated sludge system in the U.S. began operation at a poultry processing plant to provide nitrification for ammonia removal, denitrification for nitrate removal, and enhance secondary BOD and suspended solids treatment. The barrier oxidation ditch basin is preceded by an anaerobic flow equalization pretreatment basin. The oxidation ditch operates at an average volume of 700,000 gal. Three activated sludge clarifiers are operated in parallel with a total effective settling area of 1350 sq ft. One chlorine contact basin is used for combined effluent disinfection and post aeration. The single stage, low load, continuous loop reactor extended aeration activated sludge process was selected for this treatment system upgrade, based on design loadings and performance capability. Performance data shows that the Total Barrier Oxidation Ditch can be utilized as a single activated sludge treatment process, to provide very high removals of carbonaceous and nitrogenous oxygen demand and total N during the warm season months between April and October. During these months nitrification efficiency was 99%, and total N removal efficiency was 92%. During the winter season months, nitrification efficiency was reduced to 97% and total N removal efficiency was reduced to 84%. The automation of aerator oxygen transfer rate to maintain a looped reactor intake the dissolved oxygen concentration less than or equal to .2 milligrams/liter would stabilize denitrification efficiency in the warm season months and greatly improve the denitrification efficiency attainable during the winter season. CROBIOLOGY OF FILAMENTOUS BULK OF INDUSTRIAL AND DOMESTIC ACTIED SLUDGE,
nsylvania State Univ., University Park. Dept. ivil Engineering.
I. Williams, R. F. Unz, and K. Beard.
Toxic and Hazardous Wastes, Technomic Pubng Co., Lancaster, PA. 1984. p 64-77, 1 fig, 4 12 ref. CME-79189191.

Descriptors: *Activated sludge, *Microbiological studies, *Bacteria, *Biological wastewater treatment, *Culturing techniques, Wastewater treatment, Activated sludge process, Mixed liquor solids, Microorganisms, Separation techniques, Industrial wastewater, Municipal wastewater.

The distribution of filamentous microorganisms in bulking activated sludge obtained from several industrial and domestic wastewater treatment plants was investigated along with isolation procedures suitable for the recovery of filamentous microorganisms. Microscopic examination of mixed liquor specimens from treatment plants experiencing poorly settling solids, revealed the presence of one or more types of filamentous microorganisms. In general, treatment plants operated at low to medium organic loading rates produced activated sludge solids populated by Haliscomenobacter hydrossis, and Eikelboom types 0041, 0675, and 0803. Aeration basins with higher organic loading rates produced activated sludge solids populated by Sphaerotilus natans, Thiothrix spp., and types 1701 and 021 N. Pretreatment of samples from industrial and domestic sources prior to innoculation of culture media facilitated isolation of filamentous bacteria. A total of 42 axenic strains of bacteria, representing seven distinct groups of filamentous organisms, were isolated. The morphological and cytological features of the isolated bacteria are discussed. (Geiger-PTT)

UTILIZATION OF AN INDUSTRIAL WASTE OIL AS AN ALTERNATIVE FUEL FOR A MUNICIPAL SLUDGE INCINERATOR,
Tennessee Univ., Knoxville.
D. W. Weeter.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 99-107, 2 fig, 2 tab, 4 ref.

Descriptors: *Sludge disposal, *Oil recovery, *Oil wastes, *Recycling, *Sludge utilization, Wastewater treatment, Incineration, Wastewater reclamation, Cost analysis, Municipal wastewater, Waste recovery, Waste disposal, Industrial wastes.

A project to provide fuel beneficiation for a municipal sludge multiple hearth furnace incinerator at the Maryville Regional Wastewater Treatment Plant (MRWTP) is described. Waste oil sludge from the Aluminum Company of America (ALCOA) Tennessee operations was treated with alum and sulfuric acid to reclaim rolling oils. The MRWTP was modified to utilize the reclaimed oil. Fuel switching between natural gas and oil sludge was adopted along with plans to keep the incinerator temperature up when not burning sewage sludge. The new system had no major effects on water quality. The additional ash that was added by the oil was not hazardous and could be legally spread on nearby corn fields. A 50 inch induced draft fan was installed to meet New Source Performance Standards for air quality. The above ground oil storage vessel was diked to comply with EPA oil spill prevention regulations. Since the project was implemented, natural gas costs have decreased from $144 thousand to $1,000 per year. A waste exchange contract was developed between ALCOA and MRWTP.

BIOLOGICAL TREATMENT OF INDUSTRIAL WASTEWATERS IN THE USSR,
American Standards Testing Bureau, Inc., New York.
L. Shmidt.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 121-139, 4 fig, 4 tab, 4 ref.

Descriptors: *Biological wastewater treatment, *Industrial wastewater, *Sludge disposal, *Activated sludge process, *Wastewater treatment, Industrial wastes, Aeration, Chemical treatment, Sludge drying, Sludge disposal, Solid waste disposal, Pulp wastes, Waste disposal, Activated sludge.

Biological treatment is widely used for industrial wastewater treatment in the chemical, petrochemical, and pulp and paper industries in the USSR. The most widely used biological treatment process is the activated biological sludge process and its modifications. The classical plug-flow-recycle system or its modifications such as tapered or step aeration systems are most often used. The standard unit for the biological wastewater treatment facility includes an equalizer, a primary clarifier, an aeration tank and a secondary clarifier. Multi-stage systems for biological wastewater treatment have been designed over the last few years. Five categories of multi-stage systems are identified. To reduce the cost of industrial wastewater treatment, an increase in the loading of aeration tanks and biofilters is needed. The Baikal Pulp Mill wastewater treatment plant includes a biological wastewater treatment system, a chemical wastewater treatment system, lagoons for polishing and aerating wastewaters and sludge thickening, filtering, drying and combustion units. FACILITY UPGRADES DUE TO HAZARDOUS MATERIALS REGULATIONS,
GTE Government Systems Corp., Mountain View, CA. Sylvania Systems Group-Western Div.
S. M. Hochstadt.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 158-172, 3 fig, 2 tab, 10 ref.

Descriptors: *Wastewater treatment, *Cost analysis, *Hazardous materials, *Waste storage, *Wastewater facilities, Maintenance costs, Operating costs, Waste disposal, Metal-finishing wastes, Wastewater management, Industrial wastes, Industrial wastewater.

Industry faces a multitude of government regulations dealing with the storage, use, and disposal of hazardous materials in order to protect the health and safety of employees, the public, and the environment. Environmental regulations are handled under the federally legislated Clean Water, Clean Air, and Resources Conservation and Recovery Acts. The discharge of industrial process wastewaters is usually regulated by a local water district or municipal public works department. Most recently, attempts have been made to regulate the storage of hazardous materials in underground tanks. GTE Government Systems Corporation uses four separate chemical and two waste storage facilities which are being upgraded after twenty years of operation. The waste treatment system of the plating shop will feature a package treatment system for cyanide destruction, Cr reduction, pH neutralization, flocculation, clarification, sludge thickening, water recycle and sodium hydroxide. Four waste storage and four reagent storage tanks will be included. A trend of decreasing capital expenses with sharp increases in operating and maintenance initially (but leveling off after 1984) is depicted with $<10\%$ annual increase for upgrading costs. (Geiger-PTT)

INDUSTRIAL WASTEWATER TREATABILITY STUDY ACHIEVING BCT/BAT TREATMENT,
Koppers Co., Inc., Pittsburgh, PA.
A. C. Middleton, J. R. Smith, M. R. Urbassik, R. E. Keffer, and P. W. Sawchuck.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 173-185, 3 fig, 4 tab, 5 ref.

Descriptors: *Organic compounds, *Chemical coagulation, *Bioassay, *Wastewater treatment, *Activated sludge process, Organic wastes, Flocculation, Suspended solids, Toxicity, Pilot plants, Separation techniques, Chemical treatment, Biological wastewater treatment.

The Federal EPA in March 1983 issued proposed effluent guidelines for the organic chemicals, plastics and synthetic fibers industry. The guidelines require conventional pollutant parameters to be regulated by best conventional technology (BCT) and the 129 priority pollutants by best available technology (BAT). To determine the degree of treatment required to meet these limits, Koppers

Company, Inc. conducted a complete on-site wastewater treatability study at its Oil City, Pennsylvania plant. A pilot plant study simulated wastewater pretreatment for oil/water separation, activated sludge treatment, and toxicity testing of the treated effluent. Results showed that pretreatment of wastewater by FEC13 coagulation/flocculation/settling was very effective for removal of suspended matter and emulsified organic material. GC/MS analysis for organic priority pollutants in one effluent sample showed below detectable limit concentrations for all priority pollutant parameters except phenol and 2,6-dinitroluene. Results from both static and continuous flow-through fish bioassays showed the final treated effluent to be nontoxic. (Geiger-PTT)

RATIONAL PROCEDURE FOR ESTABLISHING DISCHARGE CONCENTRATION LIMITS IN MUNICIPAL SEWER USE ORDINANCES,
O'Brien and Gere Engineers, Inc., Syracuse, NY.
J. K. Farmer, S. J. Spiegel, and S. R. Garver.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 186-199, 10 tab, 10 ref.

Descriptors: *Wastewater treatment, *Effluent limitations, *Water quality standards, *Sludge disposal, *Industrial wastewater, Monitoring, Landfills, Wastewater facilities, Waste disposal, Municipal wastewater, Biological wastewater treatment, Water pollution sources, Sewer systems.

The General Pretreatment Regulations require that municipalities throughout the United States develop programs to monitor and control industrial wastewater discharges to their municipal sewer systems. Discharges to publically owned treatment works (POTW) are comprised of controllable and uncontrollable sources. The allocatable loading to the POTW for any particular substance would be derived by subtracting the uncontrollable source contribution from the total allowable POTW loading. The performance criteria to be considered in developing discharge standards includes influent and effluent effects, biological and sludge treatment, and sludge disposal. Limiting concentrations identified at specific points in the treatment system need to be translated back to the treatment plant influent. Since POTW sludges are subject to RCRA regulations if disposal is by landfilling, mathematical equations exist for calculating the maximum concentration of treatment plant influent which will prevent the sludge from being classified as hazardous. The controllable loading for each substance must then be translated to maximum industrial discharge limitations. (Geiger-PTT)

ELECTROLYTIC RECOVERY OF ZINC FROM METAL FINISHING RINSE WATERS,
Maryland Univ., College Park. Dept. of Civil Engineering.
R. W. Walters, and D. M. Vitagliano.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 251-264, 5 fig, 3 tab, 10 ref.

Descriptors: *Metal-finishing wastes, *Zinc, *Industrial wastes, *Waste recovery, *Electroplating, Heavy metals, Electrodes, Electrochemistry, Recycling, Wastewater treatment, Corrosion, Metals, Industrial wastewaters.

In an effort to meet Zn discharge limits at an electroplating firm, a review of the literature regarding electrolytic recovery of metals from dilute wastewater, an effluent characterization study to identify sources of Zn within the plant, and a preliminary bench-scale evaluation of the feasibility of electrolytic recovery of Zn, were undertaken. Results showed that the Zn automatic line accounted for 88% of the Zn discharged. An optimum strategy requiring less frequent dumping of rinse tanks would be to stagger tank dumps so that a plant discharge of 4 milligrams/liter (the discharge limit for Zn) would not be exceeded. A bench-scale, electrolytic recovery reactor was constructed and tested to study the technical feasibility of Zn removal from the plating bath rinse stream using this technique. Results showed that the reactor configuration was effective at removing Zn from the complexed, Zn cyanide wastewater. Agitation was important for achieving high rates of Zn deposition. Although corrosion had no noticeable effect on Zn removal rates, it could be a limiting factor economically for this type of wastewater. Use of lower NaCl doses resulted in comparable Zn removal with less electrode corrosion. (Geiger-PTT)

SOLUBLE-SULFIDE PRECIPITATION TREATMENT OF METAL FINISHING WASTEWATER,
Army Environmental Hygiene Agency, Aberdeen Proving Ground, MD.
J. J. Resta, M. Daly, and M. Pressman.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 265-278, 5 fig, 4 tab, 10 ref.

Descriptors: *Chemical precipitation, *Sludge thickening, *Sulfides, *Industrial wastes, *Metal-finishing wastes, Chromium, Metals, Sludge drying, Cost analysis, Sludge disposal, Performance evaluation, Wastewater treatment, Industrial wastewater, Hazardous materials, Electroplating, Metals, Heavy metals.

The performance and operation of the soluble-sulfide precipitation treatment system (SSP) for the removal of metal from finishing wastewater was evaluated at the U.S. Army Belvoir Research and Development Center in Virginia. The SSP system can reduce hexavalent Cr under neutral conditions. A sodium metabisulfite reduction system was included to minimize the amount of sodium sulfide required. Several safety features were included to reduce generation of toxic hydrogen sulfide gas. Total effluent metal concentrations in the SSP system averaged 1 milligram/liter. Sludge generation averaged 0.3 gallons of sludge/1000 gallons of wastewater treated. The sludge thickening and dewatering process performed adequately without the use of sludge conditioners. Chemical costs averaged $0.30/1000 gallons treated waste. The reactivity of the SSP system sludge could not be determined because the EPA has not promulgated a method for evaluating sulfide sludges. If the SSP sludge is determined to be a reactive hazardous waste, sludge disposal costs could limit the use of SSP treatment technology. (Geiger-PTT)

CO-PRECIPITATION OF HEAVY METALS WITH SOLUBLE SULFIDES USING STATISTICS FOR PROCESS CONTROL,
Talbot (Richard S.) and Associates, Inc., Media, PA.
R. S. Talbot.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 279-288, 8 tab, 3 ref.

Descriptors: *Industrial wastewater, *Heavy metals, *Chemical precipitation, *Wastewater treatment, *Metal-finishing wastes, *Heavy metals, Chemical treatment, Sulfides, Industrial wastes, Flocculation, Metals, Electroplating, Statistical methods.

The Talbot Process of sulfide co-precipitation was developed to help electroplating industries meet discharge pretreatment standards. The patented Talbot Process, owned by Richard S. Talbot and Associates, Inc., is used for the removal of metals that are difficult to precipitate as a metal hydroxide. The process can be used in both batch and continuous flow treatment operations, and is easily controlled through the use of statistics. The Talbot Process of sulfide co-precipitation produces a lower dissolved heavy metal content for the metals to be precipitated than conventional hydroxide precipitation alone. Sulfide co-precipitation produces a higher solids settling rate, and enhanced flocculation with anionic, organic polymers. A smaller quantity of sludge is produced as compared with conventional hydroxide precipitation leading to lower sludge disposal costs. The Talbot Process can easily be added to existing conventional systems to protect against future, more stri
heavy metals discharge standards. (Geiger-

oxic and Hazardous Wastes, Technomic Pub- Co., Lancaster, PA. 1984. p 395-410, 4 fig, 6 ref.

ptors: *Chlorination, *Coliforms, ewater treatment, *Pulp wastes, *Water , Chlorine, Biological properties, Water pol- effects, Macroinvertebrates, Industrial , Aquatic bacteria, Industrial wastewater, cal properties, Escherichia coli, Klebsiella,

The effectiveness of chlorine addition in the control of coliform bacteria in two treated papermill wastewater discharges, and in the east branch of Brandywine Creek, Pennsylvania, was examined along with chemical and biological changes in the creek due to chlorination. Eleven sampling stations were established to assess water chemistry, bacteriology, and aquatic biology from July to October 1982. Results showed that significant reductions in bacteria density during chlorination occurred only at Station 3. The densities of both Klebsiella and E. coli in the effluents of both papermills were reduced after the application of chlorine. No significant improvement in water quality is documented as a result of chlorination of the papermill effluents. Neither metals discharged from the mills, nor total residual chlorine exerted a toxic influence on aquatic macroinvertebrates. Under such conditions, the instream biological community is already somewhat limited by other discharge components making any impact attributable to chlorine difficult to detect. (Geiger-PTT)

CASE HISTORY - OPTIMIZATION OF DISSOLVED AIR FLOTATION SLUDGE THICKENER REDUCES SLUDGE TREATMENT COSTS BY ELIMINATING ADDITIONAL DEWATERING PROCESS,
J. Wozniak, and T. L. Collett.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 411-417, 3 fig.

Descriptors: *Biological wastewater treatment, *Sludge drying, *Cost analysis, *Polymers, *Oil refineries, Operating costs, Maintenance costs, Wastewater treatment, Industrial wastes, Dewatering, Sludge thickening.

In 1983, a program was initiated to reduce the costs of biological sludge treatment at a Northeast crude oil refinery and chemical plant known as the Conservation Area. The biological sludge was thickened by an optimized Dissolved Air Flotation unit (DAF). A Gravity Belt Filter Presses (GBFP's) dewatering step was eliminated, reducing overall treatment costs by $900 thousand per year. The DAF thickening performance was increased about 50%. Mechanical and polymer changes allowed for easier process start-up and a 25% capacity increase. After optimization, the final sludge concentration was consistently 10-12% total solids. The optimized in-line dilution of polymer significantly reduced costly equipment, maintenance and operator time. About one-third of the total cost savings realized represents the polymers no longer used in the GBFP's. The maintenance cost savings was about one-third of the total savings and the remaining savings were attributed to the energy costs required by the GBFP's, the polymer dilution system and the building where everything was located. BELT FILTER PRESS SELECTION FOR CHEMICAL PROCESS WASTE BIOSLUDGES,
Du Pont de Nemours (E.I.) and Co., Wilmington, DE.
K. N. Wood, and E. L. Mongan.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 418-432, 7 fig, 3 tab, 20 ref.

Descriptors: *Sludge drying, *Sludge, *Flocculation, *Sludge conditioning, *Sludge filters, Dewatering, Wastewater treatment, Sludge solids, Drying.

The design features and unique concepts employed by the various belt filter presses (BFP) used for sludge dewatering at the DuPont facilities are described. The belt press consists of a three-stage process: sludge flocculation, gravity drainage of free water, and belt pressing of dewatered sludge. Some presses offer an extra high pressure zone which is advantageous with fibrous or inorganic sludges. The Flocpress accomplishes flocculation in a rotary drum. An earlier version of the Unimat has V-shaped pockets for gravity drainage. The R. B. Carter Company BFP uses a rotating drum for flocculation and a screen-lined drum for thickening. The Klampress flocculates sludge by passing it through a vortex mixer. Testing methods of BFP's should involve selection of effective polyelectrolytes for sludge conditioning, determining mixing time and energy requirements for flocculation, recording rate and quantity of filtrate release by gravity drainage and by compression dewatering, and calculating filter cake dryness. It is suggested that more than one press manufacturer's equipment be evaluated on-site, and ample startup time be allowed for finetuning of the polymer addition system, belt tracking and other potentially tempermental aspects of the belt filter press installation. MODELING OF REACTIONS BETWEEN AQUEOUS CHLORINE AND NITROGENOUS COMPOUNDS,
Massachusetts Dept. of Environmental Quality Engineering, Westborough. Div. of Water Pollution Control.
R. A. Isaac, and J. C. Morris.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 63-75, 5 fig, 5 tab, 9 ref. DAMD 17-77-C-7051.

Descriptors: *Wastewater treatment, *Chlorination, Fate of pollutants, Model studies, Chloramines, Nitrogen compounds, Amino acids, Organic compounds, Decomposition, Chemical reactions.

A computer model is used to predict the relative amounts of selected chloramines in wastewaters. Common organic nitrogen compounds in wastewater are methylamine, di- and trimethylamine, and the amino acids. The ratio of organic N to total N in wastewaters is 0.45-1.00, median 0.92. Results show that the nature of the organic nitrogen is an important factor in the chloramine/organic-NCl distribution. In the case of glycylglycine it is likely that the amine-N and not the amide-N is being chlorinated. Decomposition of chloramines was studied by pouring a solution of HOCl into a rapidly stirred solution of the nitrogenous compound and monitoring disappearance by titrimentry or spectrometry. Half-lives (in min) of chloramines (with varying pH and temperatures) of the following compounds were as follows: alanine, 76-96; glycine, 1300-9000; histidine, 34-79; leucine, 66-79; phenylalanine, 52; serine, 33-72; tryptophan, too fast to measure; creatinine, 3300; glycine-N-acetyl ester, 19,000; glycine ethyl ester, 53-945; glycylglycine, 930-14,000; sarcosine, 192-257; and sarcosine anhydride, 2,900-12,900. Calculations show that low concentrations of dichloramine enhance disinfection but organic chloramines have no practical value in disinfection. (Cassar-PTT)

NATURAL DECHLORINATION KINETICS OF SECONDARY MUNICIPAL EFFLUENTS,
Beak Consultants Ltd., Mississauga (Ontario).
M. P. Shaw, and W. J. Snodgrass.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983, p 113-123, 3 fig, 2 tab, 20 ref.

Descriptors: *Wastewater treatment, *Fate of pollutants, *Chlorination, *Kinetics, Ponds, Design criteria, Wastewater ponds, Ultraviolet radiation, Organic matter.

The chemical kinetics of dechlorination in a natural wastewater dechlorination pond were investigated, considering temperature, ultraviolet radiation, and organic concentration. The kinetic constants delta = 0.00056 per min and gamma = 3270 degrees K should be used in the modified Arrehenius equation to predict the first-order rate constants describing natural dechlorination kinetics. Chlorine concentration should be computed in molar values. Dechlorination pond design should be based on the slowest expected kinetics, which occur in winter with ice cover. Atmospheric levels of ultraviolet radiation roughly double the first-order rate constant. (Cassar-PTT)

SEWERAGE: THE DEVELOPING COUNTRY DILEMMA,
Cole and Co. Ltd., Ottawa (Ontario).
M. G. McGarry.
IN: Water Supply and Sanitation in Developing Countries, Ann Arbor Science, Ann Arbor, MI, 1982. p 125-141, 1 fig, 3 ref.

Descriptors: *Sewer systems, *Wastewater treatment, *Cost-benefit analysis, *Developing countries, *Sanitation, Sewers, Maintenance costs, Cost analysis, Public health, Project planning, Wastewater disposal, Waste management, Economic aspects.

In the mid-nineteenth century many American and European cities had to construct sewers to handle problems of wastewater disposal. Whereas sewerage and treatment plants are being designed today to overcome environmental pollution problems of the industrialized states, the problems facing the large low-income populations of developing countries are human health-related. Usually consultants to planning projects in developing countries come from already developed nations, and these consultants have little experience with alternatives to sewerage. A cost-benefit analysis of projects to provide sewerage to Taipei, Taiwan is given to illustrate the difficulties involved in making such an assessment. Three costs of sewerage that are often overlooked are the cost of flush water, loss of the reuse potential of excreta, and increased costs for treatment of receiving waters for sewage. The necessary health education programs needed to improve hygiene in the home rarely accompany the introduction of sewerage. Community support in the education of people in sanitary practices is essential. Although technical alternatives to sewerage are now available, it will take many more years before effective delivery mechanisms are in place and operating. Plans for sewering a city center do not usually address the health problems of peripheral squatter settlements. (Geiger-PTT)

WET METHOD FOR EXCRETA DISPOSAL,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
R. L. Droste.
IN: Water Supply and Sanitation in Developing Countries, Ann Arbor Science, Ann Arbor, MI, 1982. p 157-176, 6 fig, 1 tab, 34 ref.

Descriptors: *Septic tanks, *Wastewater disposal, *Seepage pits, *Developing countries, *Sludge disposal, Waste disposal, Sewer systems, Septic sludge, Septic wastewater, Seepage, Evapotranspiration, Leaching, Economic aspects, Public health, Sanitation, Social aspects.

Financial and economic costs of wet methods for excreta disposal are less than those of a full sewerage system. The aqua-privy (AP) can handle feces and urine, with an input of water. The AP consists of a drop pipe from the toilet and a nonbaffled container discharging to a soakaway. The tank is mainly sized on the basis of the long-term buildup of solids. Since the failure to maintain the water seal is often the reason for AP failure, the addition of sullage is recommended as a design standard. Sludge levels in the AP should be checked annually. The septic tank system also relies on the on-site disposal of wastes. Estimation of the quantity of wastewater flow is the critical factor in the sizing of septic tanks. The most common means of effluent disposal is in seepage or leaching fields. The most important characteristic of the disposal field is its hydraulic conductivity. Septic tanks, AP and their leaching fields must be located away from wells, streams, and buildings. If impermeable rock or soils of low permeability exist, the evapotranspiration bed appears to be a feasible alternative. Communal toilets are often unacceptable due to inconvenience and lack of proper cleaning. Health problems may arise if sludge cleaning is not performed, water seals are not maintained, or seepage fields become clogged. The success of any system relies its acceptance by its users. (Geiger-PTT)

LOW-COST ALTERNATIVES TO SEWERAGE,
Cole and Co. Ltd., Ottawa (Ontario).
M. G. McGarry.
IN: Water Supply and Sanitation in Developing Countries, Ann Arbor Science, Ann Arbor, MI, 1982. p 143-156, 7 fig, 13 ref.

Descriptors: *Latrines, *Septic tanks, *Wastewater disposal, *Developing countries, *Sludge disposal, Waste disposal, Solid waste disposal, Economic aspects, Public health, Sanitation, Social aspects, Design criteria.

The main cause of failure of latrinization programs in the past are social and educational failure. The conventional pit latrine has been advocated by aid programs and colonial governments as part of health care projects. In dense squatter settlements, redigging of the pits after several years may cause problems in areas where there is already limited space. The vented improved pit latrine has its pit offset and a vent pipe rising from the pit's concrete cover slab. Pit desludging is done by the municipality. The revised earth closet has alternating pits to increase the capacity for storage and lengthen the time between desludging. Once filled, the first pit is closed and its contents left to digest while the superstructure is placed above the second pit. The Reed's odorless earth closet has the pit offset from the superstructure by using a straight or curved chute. This latrine is not recommended because the chute often becomes clogged. The Mozambiquan latrine is made of cement and is designed as a circular slab located over a circular pit. This type of latrine is well suited to areas where raw materials are scarce and the subsoil is unstable. The principal elements of the pour-flush latrine are the bowl, trap, and pipe. The bowl is designed to be flushed with 1-2 liters of water poured by hand. The pour-flush latrine provides a water seal between the household and the excreta storage pit. The vacuum truck and vault system collects excreta and stores it beneath the toilet for regular collection by the municipality. (Geiger-PTT)

The oxidation pond has become widely recogni as the most efficient, least costly method of mary and secondary treatment of wastewat Conventional oxidation ponds are classified three types: anaerobic, facultative and maturati The advantages of using anaerobic, facultative maturation ponds in tropical developing count are numerous. Untreated wastewater can be directly into facultative ponds, where wastes treated both anaerobically and aerobically. Ma ration ponds are placed after a series of facultat ponds and usually recieve effluents below 75 m grams/liter BOD. Land requirement for tot facultative and maturation pond systems can considerably reduced by placing anaerobic po in front of the first facultative pond. To maxim algae production for use as animal feed, oxidat ponds can be operated at detention periods of days and depths of 20-40 cm as high-rate a ponds. In East Asia, the practice of raising fish nightsoil (domestic excreta) is common. The in duction of fish to sewage-fed oxidation ponds portedly increases the quality of the final efflu Well designed and operated oxidation and mat tion ponds can achieve significant viral remov Fish resist penetration of viruses into their mu

issue while shellfish do not. Pathogenic bacteria may penetrate the meat of fish and cause health problems in improperly cooked fish. Series oxidation ponds are capable of efficient removal of many human parasites. (Geiger-PTT)

Descriptors: *Maintenance, *Project planning, *Wastewater treatment, *Water supply development, *Sanitation, Evaluation, Management planning, Future planning, Maintenance costs, Developing countries, Manpower, Economic aspects, Water supply, Education.

In order to operate properly, water supply and sanitation systems must receive the proper maintenance. Planned maintenance attempts to anticipate and avoid interruptions of service. Breakdown maintenance, a form of crisis intervention, tries to restore service in malfunctioning systems as quickly as possible. In a survey conducted by the General Accounting Office which showed failure of the majority of wastewater treatment plants to meet water discharge standards, the lack of proper maintenance was cited as the second most frequent cause of failure. In developing countries, systems are frequently broken down. Local resources are usually all that is needed to keep a hand pump water supply system in operation. The United Nations Children's Fund conducted an educational program on the maintenance of water supplies. Piped water supplies that involve treatment and pumping are also very vulnerable to failure in rural areas. To keep water and wastewater systems operating properly, the agency responsible for maintenance must have reliable transport fleet. When planning, financing, construction and operation of system are all undertaken locally, local personnel can handle any maintenance problems. Design criteria should consider local customs and the use of locally available materials. For the effective operation and maintenance of water and sanitation systems, motivation, good management, money and power must be present. In planning new water supply and sanitation projects, the planner should first evaluate what is wrong with the present system. (Geiger-PTT)

Ultimate Disposal Of Wastes

PHYSICAL PROPERTIES AND LEACH TESTING OF SOLIDIFIED/STABILIZED INDUSTRIAL WASTES.
Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Lab.
Available from the National Technical Information Service, Springfield, VA 22161 as PB83-147983, Price codes: A07 in paper copy, A01 in microfiche. EPA-600/2-82-099, December 1982. 135 p, 21 fig, 15 tab, 15 ref, 3 append. EPA-IAG-D4-0569.

Descriptors: *Sludge treatment, *Waste disposal, Industrial wastes, *Leaching, Landfills, Metals, Heavy metals, Waste treatment, Toxic wastes, *Waste stabilization, *Water pollution control.

Physical property and leaching tests were conducted to assess the engineering characteristics and pollution potential of five industrial wastes (sludges from electroplating, Ni-Cd battery manufacture, pigment production, chlorine production brine, and glass etching). Four solidification/stabilization processes were used to produce different types of treated-waste products: (1) one resembling low-strength concrete, (2) a rubber-like solid, (3) a solid plastic-encased block, and (4) a soil-like material. No correlation between the physical properties of the treated products and their ability to contain the sludge constituents in leach testing was found. The soil-like product had the highest permeability and lowest strength and durability, but it gave the best overall containment of all the treated-waste products except the polyethylene-jacketed waste. Although the rubber-like solid was strong and durable, it produced the leachate with the highest concentration of pollutants. Leach tests were conducted with carbon dioxide-saturated water at a flow rate of 0.00005 cm/sec for 1-2 years. In all cases leachates were higher in heavy metals and anions than drinking water standards. No treatment process other than plastic encapsulation uniformly reduced the concentration of all potential pollutants for all sludge types; however, the overall pollution potential was lowered. In some cases, additional leachable materials were added in the treatment process. Some treatment processes increased the solubility of certain constituents so that they were lost at higher rates than in untreated sludge. (Cassar-PTT)

OPERATING EXPERIENCE IN HAZARDOUS WASTES DISPOSAL BY POZZOLANIC CEMENTATION,
Envirosafe Services, Inc., Horsham, PA.
C. L. Smith, and T. Longosky.
IN: Hazardous and Toxic Wastes: Technology, Management and Health Effects, The Pennsylvania Academy of Science, Easton, PA. 1984. p 64-76, 3 fig, 7 tab, 10 ref.

Descriptors: *Waste disposal, *Cement, Pozzolanic cementation, Landfills, Envirosafe process, Organic compounds, Sludge, Paper coating industry, Steel industry, Metal-finishing industry, Oil, Fly ash, Encapsulation.

A pozzolanic cementation process has been used for hazardous waste disposal by the Envirosafe Services facility, Honeybrook, Pa., since early 1980. Fly ash is blended with the waste, then lime is added. The basic chemistry is similar to that of portland cement hydration and hardening, producing a material of high compressive strength with permeability coefficients in the range of 10 to the minus 6 power cm/sec. The processed waste, with the consistency of damp soil, is trucked to a landfill, where it is spread, graded, and compacted. Essentially zero leachate is generated by the landfill, and no impact on monitoring wells has been detected. Some wastes are not suitable for this process, notably those with high sugar content. Specific details are given for several wastes: paper coating wastes (50% complex organics with inorganic pigments and clays), air pollution residue from steel production (zinc, iron, calcium), and rolling mill oil-bearing sludge (quartz, oil and grease, heavy metals). GEOLOGICAL FACTORS IN DISPOSAL SITE SELECTION,
Pennsylvania State Univ., University Park. Dept. of Geosciences.
R. F. Schmalz.
IN: Hazardous and Toxic Wastes: Technology, Management and Health Effects, The Pennsylvania Academy of Science, Easton, PA. 1984. p 124-136, 52 ref.

Descriptors: *Waste disposal, *Water quality control, *Landfills, *Geology, Geohydrology, Soil properties, Groundwater movement.

Reinforced concrete vaults and other man-made containers for burial of hazardous waste have failed within 20 or 30 years in many instances. Therefore, proper selection of a suitable geological site is very important for long-term safe storage. Essential criteria for a successful shallow land burial site are as follows: (1) sufficient depth of soil or regolith to accomodate the burial cells, (2) a water table of sufficient depth to guarantee that the cells are above the zone of saturation at all times, (3) a surface water regimen which allows drainage away from the cells, (4) soil or regolith which is homogeneous and impermeable so that groundwater flows aways from the site, and (5) a stable geological environment. Guidelines are given for choosing or excluding a site for hazardous waste disposal. A four-level process is used to quickly eliminate unsuitable sites from consideration. The first level excludes sites on a regional basis (volcanic activity, flood plains, population centers, permeable bedrock, etc.). The second level considers site-specific problems (eliminating places subject to exceptional storms, landslides, local areas of fractured rock, steep slopes, mines, usable aquifers). Interactive site-specific criteria consider interrelationships between two or more factors, such as soil transmissivity and depth to water table. Factors which enhance the suitability of a site for waste disposal include transportation facilities, backfill sources, and absorbant or neutralizing soil. (Cassar-PTT)

FIXATION OF SEWAGE SLUDGE AND FLY ASH; AN ALTERNATIVE METHOD FOR OCEAN DISPOSAL,
State Univ. of New York at Stony Brook.
C-S. Shieh, and F. J. Roethel.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 433-443, 5 fig, 3 tab, 15 ref.

Descriptors: *Solid waste disposal, *Ocean dumping, *Sludge disposal, *Fly ash, *Mine wastes, Waste disposal, Sludge drying, Sludge conditioning, Dewatering, Sludge thickening, Reefs, Chemical properties.

The Coal Waste Artificial Reef Program (C-WARP) has proven the environmental acceptability of waste stabilization and ocean dumping of dewatered sludge mixed with fly ash while forming an artificial reef for fishing. Test samples of solid cylinders (11.9 cm by 10.2 cm) or a fly ash-sewage sludge (FA-SS) mixture were tested for permeability, compressive strength, electron microscopic appearance, and chemical properties (elemental analysis). Results showed that the compressive strength of the FA-SS block was a function of curing time, temperature, moisture, and additive contents. Scanning electron micrographs of sewage sludge indicate that the sludge is composed of an irregular flaky material. Permeabilities ranged from 0.00001 to 0.000001 cm/sec over the periods of the experiment. Concentrations of Al, Cu, Zn and Pb in the exterior portions of the FA-SS blocks increased with time after exposure to seawater while a steady decrease of Cd was also observed. These findings show that blocks maintain their structural integrity and may provide an acceptable option for ocean dumping of solid wastes. (Geiger-PTT)

DEALING WITH LANDFILLED HAZARDOUS SLUDGE, OTHER ALTERNATIVES,
Maryland Dept. of Health and Mental Hygiene, Baltimore. Office of Environmental Programs.
G. Z. Francis.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 444-455, 4 fig, 3 tab.

Descriptors: *Groundwater pollution, *Landfills, *Leachates, *Sludge disposal, *Water pollution prevention, Leaching, Waste disposal, Solid waste disposal, Water quality, Industrial wastes, Calcium carbonate, Nickel, Boreholes, Acid rain, Cost analysis.

A study was conducted to test leachate and groundwater quality of a major industrial facility in Maryland. The landfilled sludge consists of a mixture of three types of wastes: electroplating sludges, paint residues, and industrial painting wastewater treatment sludges. Twelve boreholes were drilled in the vicinity of the disposal site and groundwater monitoring wells were installed in five of these boreholes. Groundwater was monitored continuously for three months. No evidence of groundwater quality deterioration was observed over a 4-yr period, although natural precipitation was suspected as a source of leachate for Ni. It was recommended that the site be closed and a 1-inch layer of calcium carbonate be applied to its surface to neutralize acid precipitation in the facility's area for more than 800 years. Total closure cost is estimated at $100,000 to $120,000 while digging out the waste and disposing of it by some other means would cost an estimated $900,000 to $1,000,000. (Geiger-PTT)

ENVIRONMENTAL AND ENGINEERING ASPECTS RELATED TO THE RESTORATION OF A FERROUS SULFATE (COPPERAS) WASTE DISPOSAL SITE,
Virginia Polytechnic Inst. and State Univ., Blacksburg.
W. R. Knocke, J. T. Novak, G. L. Goodman, M. Morris, and J. Moslehi.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 487-496, 2 fig, 3 tab, 2 ref.

Descriptors: *Solid waste disposal, *Landfills, *Leachates, *Ferrous sulfate, *Groundwater pollution, Waste disposal, Acidic water, Land disposal, Sulfates, Linings, Leaching, Water pollution sources, Environmental effects, Water pollution effects, Cleanup, Clays.

An assessment of environmental damage associated with the burial of waste ferrous sulfate or copperas at an abandoned Ti processing facility in Nelson County, Virginia and related engineering improvements associated with the sites cleanup was made in the summer of 1983. Results showed extreme cracking of the top clay liner which allowed rainfall to percolate directly into the buried copperas. The extremely acidic surface seepage erradicated all vegetation with which it came in contact. Evaluations of soluble Al concentrations in roundwater showed a significant change in the mineralogical structure of contaminated soils which was hypothesized to be directly related to the release of Al during acidic decomposition of the soil matrix. An increase in permeability as a function of exposure time to copperas leachate could also occur. River water samples collected along the Piney River both upstream and downstream of all identified surface runoff locations at the plant site, showed significant decreases in pH due to groundwater contamination. Laboratory tests show increased permeabilities of clay lining materials due to copperas. Remedial action included regrading the surface, depositing a 2-ft clay cover and planting vegetative cover to aid in rainfall drainage and evapotranspiration. (Geiger-PTT)

PREDICTING LEACHATE GENERATION IN LANDFILLS: A NEW METHOD,
Anderson (James C.) Associates, Camden, NJ.
J. R. Gee.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 548-567, 4 fig 8 tab, 21 ref. C2521NASX.

Descriptors: *Landfills, *Lysimeters, *Leachates, *Percolation, *Mathematical equations, Models, Simulation analysis, Leaching, Soil water, Statistical analysis, Computer models, Model studies, Waste disposal.

A summary of part of a research effort to develop a more direct method of landfill percolation prediction based on the percolation process itself rather than on the processes surrounding it is presented. Factors were selected for measurement which could be easily measured in the field. They are: rainfall amount, initial soil moisture content, soil density, slope, and runoff. Using a specially designed rainfall simulator and lysimeters, laboratory testing of five different landfill cover soils were carried out. Rainfall simulator data was analyzed using the MINITAB statistical computer program. An extensive nuumber of linear equations were analyzed to find a good relationship between the variables selected. In addition to the equations generated, the Thornthwaite Water Balance, HELP and HSSWDS computer models were also used to predict leachate generation at Cell 1 of the Madison solid waste lysimeters from 1972 to 1975. Predicted values from both the physical and non-physical rainfall simulator models and their laboratory determined coefficients showed better accuracy than existing water balance methods on a monthly and yearly basis. HAZARDOUS WASTE MANAGEMENT FOR THE 80'S.
Ann Arbor Science, Ann Arbor, MI. 1982. Edited by T. L. Sweeney, H. G. Bhatt, R. M. Sykes, and O. J. Sproul. 553 p.

Descriptors: *Waste disposal, *Waste management, *Groundwater pollution, *Industrial wastes, *Waste identification, *Landfills, On-site investi tions, Cleanup operations, Legal aspects, Fi tests, Groundwater, Environment, Polluta Aerial photography, Water, Leachates, Mathen ical models.

A series of papers reflecting current work on c cal issues in hazardous waste management (incl ing groundwater and seepage; treatment, stor and disposal; site cleanup; and safety and le considerations) is presented. A variety of indust contaminants are considered, and many pract problems involved in disposal (particularly l disposal) are addressed. Site assessment, conta ment and encapsulation of hazardous waste disp al sites, hazardous waste site cleanup, and reme action for abandoned waste sites are among topics covered. Groundwater monitoring, conta nation and recovery are discussed. Several c histories are presented to illustrate the vari topics. (Halterman-PTT)

CLASSIFICATION AND MANAGEMENT PROCESS WASTES FOR THE TENNESS SYNFUELS ASSOCIATES COAL-TO-GA LINE FACILITY,
R. W. Rittmeyer, J. P. Fillo, D. P. Malik, A. J. Merritt, and J. P. Brennan.
IN: Hazardous Waste Management for the Ann Arbor Science, Ann Arbor, MI, 1982. p 45 4 fig, 7 tab, 9 ref.

Descriptors: *Industrial wastes, *Waste dispo Waste identification, Solid wastes, Solid waste posal, Land disposal, Landfills, Regulations.

A plant proposed by the Tennessee Synfuels A ciates for the production of gasoline from loc available bituminous coal is described, and development of an inventory, preliminary clas cations, and management options for pro wastes expected from the facility are reported. features of the 1976 Resource Conservation Recovery Act which apply to this plant are viewed. For each plant operating area, the gene ed wastes, generation rate and schedule, poten hazard classification, and proposed managem techniques for various wastes are presented in ular form. A schematic for probable waste man ment techniques is included. The information resents best estimates base on current pro design. The facility (50,000 barrels per day ca ity) will generate approximately 4.6 million t year of raw wastes in five categories: coal-deri wastes (77%), organic wastes (4%), byprod (4%), spent catalysts (0.06%), and other wa (15%). In-process management will reduce amount of wastes actually leaving process unit 2.4 million tons/year, 87% of which will be d derived. Hazardous wastes will be subjected routine analysis and non-hazardous wastes wil analyzed at least annually. (Halterman-PTT)

ROLE OF THE ANALYTICAL LABORATORY IN HAZARDOUS WASTE MANAGEMENT,
Harmon Engineering and Testing, Auburn, AL.
V. K. Varma, B. B. Ferguson, and M. S. Shearon.
IN: Hazardous Waste Management for the 80's, Ann Arbor Science, Ann Arbor, MI, 1982. p 115-141, 2 fig, 3 tab, 11 ref.

Descriptors: *Industrial wastes, *Waste disposal, *Waste identification, *Environment, Waste management, Groundwater, Laboratories, Regulations, Legal aspects.

Several aspects of the role of the analytical laboratory in hazardous waste management are addressed, including examination of selected analytical considerations, presentation of selected case studies, and guidelines for obtaining laboratory services. The functions of the analytical laboratory within the Hazardous Waste Management (HWM) system of the Resource Conservation and Recovery Act (RCRA) fall into three categories: waste identification; waste and waste constituent monitoring; and treatment, clean-up and other certifications. Programs which have been developed specifically for meeting the compliance objectives of the HWM system are described in detail. These programs include waste identification, delisting of waste sources and specific wastes, groundwater monitoring plans, and waste analysis plans. The analytical chemistry considerations discussed include sample collection and preservation, analytical interferences, instrumentation, and quality control. Three case studies illustrate the role of the analytical laboratory in the HWM system decision-making process. (Halterman-PTT)

LAY LINER PERMEABILITY - A PROBABI-STIC DESCRIPTION,
arnegie-Mellon Univ., Pittsburgh, PA.
O. Harrop-Williams.
: Hazardous Waste Management fr the 80's, Ann rbor Science, Ann Arbor, MI, 1982. p 307-314, 2 , 13 ref.

escriptors: *Landfills, *Waste disposal, *Permeility coefficients, *Mathematical models, Model dies, Liquid wastes, Solid wastes, Environment.

e primary criterion used in evaluating the suitlity of hazardous waste landfills for containing zardous waste is permeability, and many regulay agencies have adopted regulations requiring y-lined hazardous waste landfills to have a coefent of permeability no greater than a fixed ue. However, permeability is one of the most iable of engineering properties and its behavior est described using probability theory. A model leveloped to predict the uncertainty associated h specified permeability values. Using this del, it is possible to establish confidence levels ociated with possible ranges of the coefficients permeability of clay-lined hazardous waste land-. The probability density function of the coeffint of permeability is derived from a microscope w of flow through soils. In developing this del, the permeant was assumed to be a neutral nt (e.g., water). However, as is usually done in y-liner design, this model can be modified to ude the effect of chemicals on the clay. (Halter-PTT)

CONTAINMENT AND ENCAPSULATION OF HAZARDOUS WASTE DISPOSAL SITES,
A. A. Metry.
IN: Hazardous Waste Management for the 80's, Ann Arbor Science, Ann Arbor, MI, 1982. p 315-342, 7 fig, 5 tab, 10 ref.

Descriptors: *Waste disposal, *Landfills, *Environmental engineering, Radioactive wastes, Solid wastes, Environmental effects, Computer models, Environment, Wastes.

State-of-the-art techniques for containment and encapsulation of hazardous waste disposal sites are discussed. Such techniques have been applied as remedial action for inactive hazardous waste disposal sites containing chemical, toxic and low-level radioactive materials. The use of computer simulation for optimization of design features is discussed, and techniques for evaluation of cover, liner and barriers are presented and illustrated. The case history presented is for a large site containing low-level radioactive waste, but can be applied to other types of hazardous waste. Components of the cover system are considered, with 18 cover types being evaluated based on 20 performance criteria. In a discussion of the function of the liner system, 12 materials are evaluated. It is concluded that it is preferred to utilize passive rather than active techniques for encapsulating waste-disposal sites. Multilayer cover systems, soil/clay liners, bentonite slurry walls and ion-exchange barriers represent the basic elements of remedial action that do not require perpetual postclosure operations. (Halterman-PTT)

ESTIMATES OF SEEPAGE THROUGH CLAY COVERS ON HAZARDOUS WASTE LANDFILLS,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
S. J. Wright, and C. P. Miller.
IN: Hazardous Waste Management for the 80's, Ann Arbor Science, Ann Arbor, MI, 1982. p 343-356, 4 fig, 2 tab, 13 ref.

Descriptors: *Waste disposal, *Landfills, *Linings, *Leachate, Model studies, Mathematical models, Wastes, Industrial wastes, Environment.

The importance of estimating the amount of leachate generated in a hazardous waste landfill is stressed, and several methods available for the estimate of leachate rates are described, along with their shortcomings. An alternative method, based on a numerical model and using a more mechanistic approach, is presented. The example is based on a hypothetical landfill, but with meteorological information from a specific location. Three conclusions can be reached. First, the leakage rates through the clay layer are greater than the saturated hydraulic conductivity which is often stated to be the case for fully saturated flow. Leakage rates of four or five times this value can be computed. Second, if the total potential leakage into the clay is of the same order of magnitude as the saturated hydraulic conductivity or less, the liner will accept all downward flow. And third, the thickness of the clay liner only affects the time that it takes for a significant amount of leakage to begin to enter the landfill and has little effect upon the seepage rates. (Halterman-PTT)

MUNICIPAL SOLID WASTE MANAGEMENT FACILITY LOCATION MAPPING: SUPPORT ACTIVITIES REPORT,
Texas Natural Resources Information System, Austin.
Report TNRIS-031, January 1983. 22 p, 5 fig, 2 tab, 2 ref, append.

Descriptors: *Texas, *Waste disposal, *Computer programs, *Waste management, *Solid waste disposal, *Waste dumps, Automation, Municipal wastes, Landfills, Composting, Permits, Maps, *Mapping.

The Texas Department of Health (TDH) was designated by the 'Solid Waste Disposal Act,' Article 4477-7, Vernon's Texas Civil Statutes, as the Texas agency responsible for providing standards for managing the collection, handling, storage, and disposal of municipal solid waste. TDH is empowered by the Act to require and issue permits authorizing and governing the operation and maintenance of sites used for the management (including disposal) of solid waste. The Department has for some time maintained automated records associated with each permit application and each permitted site. Although the geographic coordinates of each existing or proposed site were on the file, no systematic means was available for displaying the site locations by geographic coordinates as computer-generated maps. By including site location data in the TNRIS Geographic Information System (GIS), TDH can display the data along with a variety of other geographic information already included in the GIS. Data can be reproduced at any scale in any of eight available geographic projections. TNRIS System Central staff provided computer software to establish a GIS file which included the type, location, and status of each proposed or existing municipal solid waste management site. Plots of the data have been used by TDH for a variety of purposes including scheduling of public hearings and (in conjunction with maps showing physical and geological features and population) to identify areas of potential concern related to each site. SANITATION ASPECTS OF WATER SUPPLY AND EXCRETA DISPOSAL,
Ministry of Health, Lilongwe (Malawi).
W. G. Bomba.
IN: Water Supply and Sanitation in Developing Countries, Ann Arbor Science, Ann Arbor, MI, 1982. p 311-325, 5 fig, 2 tab, 9 ref.

Descriptors: *Sanitation, *Public health, *Waste disposal, *Water supply, *Developing countries, Water quality, Drinking water, Case studies, Water supply development, Water quality control, Water quality management, Pathogens, Infection, Human diseases, Social aspects.

The improvement of public health in developing countries can only arise through satisfactory systems of water supply, sanitation and health education. The role of health education in sanitation programs is highlighted using two case studies - a water study in Lesotho and latrinization program in Malawi. The principal human diseases that can be transmitted by water and their causative agents (bacteria, protozoa, viruses, and helminths) are reviewed. Many water-related diseases have more than one route of transmission. The ingestion of food or drink contaminated with feces, infection from contact with water, transmission from contact with soil, infection via insect vectors, and infection via meat are considered. Education programs had to be adopted in Malawi to encourage people to use latrines. Water contamination may take place when water is drawn from unprotected

sources, when drawn from taps into contaminated containers, or when storage containers inside the home are left uncovered. Coliform bacteria is usually used as an indicator of drinking water quality. The decision to condemn a certain water supply should be left to those who know the local circumstances and who are responsible for safeguarding the health of the community. (Geiger-PTT)

5F. Water Treatment and Quality Alteration

ZETA POTENTIAL STUDY OF THE WATER TREATMENT OF GEOTHERMAL BRINES,
Idaho National Engineering Lab., Idaho Falls.
P. M. Wikoff, and D. F. Suciu.
Available from the National Technical Information Service, Springfield, VA 22161 as DE-005910, Price codes: A03 in paper copy, A01 in microfiche. Report EGG-GTH-5673, November 1981. 27 p, 15 fig, 3 tab, 7 ref. DE-AC07-761D01570.

Descriptors: *Water treatment, *Cooling water, *Flocculation, Corrosion control, Geothermal studies, Zeta potential, Silica, Phosphates, Ferrous sulfate, Polymers, Adsorption, Magnesium oxide, Lime, Brines.

Zeta potential studies on geothermal cooling water were performed on the silica reduction system and the phosphate reduction system. In the silica reduction system, data suggested that adsorption occurred between the magnesium hydroxide formed in solution and the silica. Addition of calcium ion caused a bridging type of adsorption between the silica-magnesium hydroxide particles. The optimum magnesium oxide concentration, added as magnesium chloride, was 150-200 ppm MgO. Optimum pH, adjusted with lime, was 10.2. The best polymer was Betz 1125L at a dose of 1 ppm. An excess of polymer (8 ppm or greater) left more silica in solution. In the phosphate reduction system the optimum iron concentration was 20-30 ppm added as ferrous sulfate. Optimum pH, adjusted with lime, was 9.2 Betz 1195, a cationic polymer, produced the largest, best-selling flocs at an optimum concentration of 2-4 ppm. Since the phosphate studies were done on domestic water, further research is needed to account for the zinc sulfate or dispersants normally present in blowdown water. (Cassar-PTT)

TREATMENT ALTERNATIVES FOR GROUNDWATER CONTAMINATION,
Montgomery (James M.), Inc., Reston, VA.
A. R. Appleton, and M. Kavannaugh.
IN: Toxic and Hazardous Wastes, Technomic Publishing Co., Lancaster, PA. 1984. p 351-383, 6 fig, 10 tab, 33 ref.

Descriptors: *Aeration, *Groundwater pollution, *Activated carbon, *Design criteria, *Case studies, Water treatment, Adsorption, Organic compounds, Water quality control, Odor, Taste, Water pollution sources, Cost analysis.

Several options are available for the removal or reduction of carcinogenic compounds from groundwater. These include: source control, blending with uncontaminated sources, development of new sources, treatment of contaminated sources, and point-of-use treatment. Physicochemical parameters of organic compounds are useful in predicting their behavior in the environment and removal efficiencies in treatment processes. Aeration processes, particularly packed tower air stripping, may be effective in treating contaminated groundwaters. Similarly, the octanol:water partition coefficient is useful in predicting the effectiveness of granular activated carbon adsorption for removal of specific compounds. More accurate cost estimates for CAC adsorption, as well as aeration, require full-scale design criteria obtained through site specific pilot-scale studies. Two case studies from Southern California are presented to illustrate full-scale applications of treatment processes for the removal of organic compounds from groundwaters. The Valley County Water District used an air stripping system for the removal of trichloroethane and the City of La Habra used a packed tower to alleviate taste and odor problems. (Geiger-PTT)

WATER CHLORINATION: ENVIRONMENTAL IMPACT AND HEALTH EFFECTS; VOLUME 4, BOOK 1: CHEMISTRY AND WATER TREATMENT,
Proceedings of the Fourth Conference on Water Chlorination: Environmental Impact and Health Effects, Pacific Grove, California, October 18-23, 1981. Ann Arbor Science, Ann Arbor, MI. 1983. 2 v. (1491 p.) Edited by Robert L. Jolley, Wiliam A. Brungs, Joseph A. Cotruvo, Robert B. Cumming, and Jack S. Mattice.

Descriptors: Fate of pollutants, *Water treatment, *Chlorination, *Pollutant identification, *Water analysis, Chloramines, Bromination, Organic compounds, Trihalomethanes, Chlorinated hydrocarbons, Chlorine demand, Residual chlorine, Wastewater treatment, Wastewater analysis, Kinetics, Chemical reactions, Activated carbon, Humic acids, Fulvic acids, Oxidation, Organic matter, Cooling water, Seawater, Disinfection, Chromatography, Trace levels.

This volume concerns the chemistry of water treatment, emphasizing the fate and effects of chlorine. Section I describes the chemistry of nitrogenous and other compounds, including the products of halogens with ammonia, amino acids, proteins, polynuclear aromatic hydrocarbons, and lipids. Section II, the chemistry of chlorine demand, considers the products formed when chlorine and bromine react with aquatic humic materials and other organic matter to form trihalomethanes and other halogenated compounds. Section III discusses the fate of chlorine and the formation of halogenated organic compounds in cooling water, drinking water, wastewater, and municipal landfill leachates. The alternative disinfectants, hydrogen peroxide and ozone, are evaluated. Analytical methods are presented in Section IV and V. They include methods for analyzing halogenated organic mixtures as well as for determing chloramines, residual chlorine, and residual oxidants attrace levels. Several systems for continuous monitoring are described. (Cassar-PTT)

REVIEW OF THE CHEMISTRY AND ENVIRONMENTAL FATE OF REACTIVE OXIDANT SPECIES IN CHLORINATED WATER,
Oak Ridge National Lab., TN.
R. L. Jolley, and J. H. Carpenter.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 3-47, 4 fig, 7 tab, 118 ref. EPA079-D-X0789.

Descriptors: *Water treatment, *Literature reviews, *Chlorination, *Bromination, *Oxidation, Chemical reactions, Organic compounds, Chloramines, Bromamines, Trihalomethanes, Wastewater treatment, Hypochlorous acid, Hypobromous acid, Iodine, Chlorine demand, Fate of pollutants, Ammonia, Nitrogen compounds.

This review concerns the chemistry of chlorine in wastewaters and in natural waters as it pertains to the formation, degradation, and reaction products of free and combined oxidants. Chlorine hydrolyzes very rapidly in water to form hypochlorous acid, which upon dissociation forms hypochlorite ion. As pH increases, the hypochlorite ion becomes more dominant than the undissociated acid. Chlorine added to water containing bromide yields hypobromous acid and chloride ion. Dissociation of hypobromous acid forms hypobromite ion, which is dominant at higher pH. Chlorination of iodine-containing water produces molecular iodine and chloride. Ammonia combines with hypohalous acids to form mono- and dihalamines as well as nitrogen tribromide and trichloride. Monochloramine and dibromamine are common constituents of chlorinated and brominated wastewaters. Although monochloramine is a less effective chlorinating agent than hypochlorous acid, it minimizes formation of trihalomethanes during water treatment. Chlorine or bromine plus amino acids or other nitrogen-containing organics yields organic chloramines or bromamines. Knowledge of the organic halamines and their reaction products in natural water is limited. Bromochloramines can form in salt water systems. Chlorine demand, the difference between chlorine dosage applied to water and the measured available chlorine, is a result of inorganic oxidation and reactions with organic matter. Disproportionation of hypohalous acids (e.g., formation of chlorate and chloride) takes place at basic pH. Photochemical or catalytic influence cause hypohalous acids to decompose yielding oxygen. Free available chlorine also reacts with organic matter to form a complex mixture of organohalides. (Cassar-PTT)

CRITICAL REVIEW OF KINETIC AND THERMODYNAMIC CONSTANTS FOR THE AQUEOUS CHLORINE-AMMONIA SYSTEM,
Harvard Univ., Cambridge, MA. Dept. of Applied Science.
J. C. Morris, and R. A. Isaac.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 49-62, 4 fig. 2 tab, 19 ref. DAMD 17-77-C-7051.

Descriptors: *Water treatment, *Chlorination, *Chemical reactions, *Nitrogen compounds, Chloramines, Hydrolysis, Kinetics, Thermodynamics.

Tables list a complete summary of the kinetic and equilibrium constants and the derived thermodynamic quantities for reactions of the aqueous chlorine-ammonia system. Reaction systems considered are (1) monochloramine + water yield ammonia + hypochlorous acid, (2) dichloramine + water yield monochloramine + hypochlorous acid, (3) nitrogren trichloride + water yield dichloramine + hypochlorous acid, and (4) disproportionation of monochloramine to yield ammonia and dichloramine. Some of the values are less accurate than desired; some are based on relatively insecure assumptions. However, trends are seen in reactivity, degree of phydrolysis, and endothermicity. (Cassar-PTT)

ULTRAVIOLET ABSORPTION SPECTRA OF BROMOCHLORAMINE AND DIBROMOCHLORAMINE IN ETHER,
Tennessee Univ., Knoxville. Dept. of Chemistry.
W. R. Haag, and R. L. Jolley.
IN: Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983, p 77-83, 2 fig, 10 ref.

Descriptors: *Water treatment, *Chlorination, Chloramines, Bromochloramines, Spectrometry.

Ultraviolet absorption spectra were determined for bromochloramine and dibromochloramine in ether. These compounds were prepared by mixing hypobromite solution with monochloramine. At a HOBr/NH2C1 molar ratio <0.4 two new peaks at 220 and 333 nm were always observed on top of

the monochloramine spectrum, and the increase in absorbance between successive experiments was proportional to the difference in the amount of bromine added, suggesting that a single new compound (NHBrC1) had been formed. Increasing the HOBr/NH2C1 molar ratio above 0.5 produced spectra which indicated the formation of NBr2C1. Based on the ether spectra, the NBrC12 peak in water, at 230 nm with maximum extinction coefficient of about 7000. Possible reasons that these compounds have not been detected in chlorinated saline water are (1) overlapping absorption bands caused by mixtures of halamines and (2) rapid decomposition of the bromochloramines. DIHALOACETONITRILES IN CHLORINATED NATURAL WATERS,
Florida Atlantic Univ., Boca Raton. Dept. of Chemistry.
. I. Bieber, and M. L. Trehy.
N: Water Chlorination: Environmental Impact nd Health Effects; Volume 4, Book 1: Chemistry ed Water Treatment, Ann Arbor Science, Ann rbor, MI. 1983. p 85-96, 3 tab, 30 ref.

escriptors: *Water treatment, *Chlorination, Dihloacetonitriles, Chlorinated hydrocarbons, Nitrogen compounds, Amino acids, Dichloroacetonitrile, Dibromoacetonitrile, Proteins, Trihalomethanes, Activated carbon, Absorption, Chloramine.

ichloroacetonitrile, dibromoacetonitrile, and bromochloroacetonitrile were identified in chlorinated tural waters in south Floriday. Thes result from lorination of proteinaceous materials such as certain amino acids and polypeptides. Aspartic acid d aspartyl residues are especially prolific dihacetonitrile (DHAN) producers. Chlorination of e water at 6 and 20 mg/liter chlorine for 15 min owed that increasing concentrations of DHANs re formed with increasing contact time. Levels DHANs were also higher at the 20 mg/liter el. For example, at 20 mg/liter and 15 min ntact time concentrations in ppb were as follvs: dichloroacetonitrile, 5.2, and bromochloroonitrile, 0.4. Likewise, the concentrations of alomethanes (THMs) increased with dose and ntact time. Levels of total THMs produced in e water samples at 20 mg/liter chlorine and 15 contact time were 182 ppb. Activated carbon be used to remove DHAN precursors, but the cess is energy-intensive, costly, and has many iables. Lime treatment increases water pH, rtens the half-lives of the DHANs, but inases the levels of THMs formed. Use of chlorne as a disinfectant maintains low levels of AN. (Cassar-PTT)

oxidizing agents assayed by standard chlorine ses are known to disappear on time scales ng from minutes to days, depending on treat- conditions and water quality but the reacresponsible for this disappearance are poorly n. An assortment of evidence points to reactions involving organic matter as major chlorine consumers, but it is generally agreed that formation of halocarbons is minor. Experiments in which river water was treated with about 150 microM of NaOC1 (about 10 ppm C12) produced about 35 microM of carbon dioxide. However, oxidation of organic matter to carbon dioxide in these experiments definitely cannot account for all the chlorine decay and probably accounts for only about half of it. Investigation of the effect of chlorination on protein macromolecules showed a general loss of protein amino acids after chlorination, as well as a more pronounced loss of the specific amino acids that possess reactive side groups (lysine, histidine, arginine, methionine, and tyrosine). Because only two reaction products were observed during amino acid analysis by liquid chromatography and gas chromatography, it is concluded that most off the reactive amino acids are substantially altered or totally oxidized by chlorination. The general loss of protein could be caused by scission of the protein chain at sites occupied by reactive amino acids, yielding polymer fragments too small in some cases to be recovered by ultrafiltration. EVALUATION OF OZONE PRETREATMENT OF SURFACE WATERS PRIOR TO CHLORINATION FOR REDUCTION IN TRIHALOMETHANE FORMATION,
Oklahoma State Univ., Stillwater. School of Civil Engineering.
J. N. Veenstra, J. B. Barber, and P. A. Khan.
IN: Water Chlorination: Environmental Impact and Helath Effects; Volume 4, Book 1: Chemistry and Water Treatment, Ann Arbor Science, Ann Arbor, MI. 1983. p 455-465, 7 fig, 1 tab, 10 ref.

Descriptors: *Water treatment, *Ozonation, Chlorination, Trihalomethanes, Organic carbon, Chlorinated hydrocarbons, Kaw Lake, Oklahoma, Disinfection.

Ozone pretreatment of Kaw Lake (Oklahoma) water before chlorination affected reductions in

the total organic carbon (TOC) and trihalomethane(THM)-forming potential. With mean absorbed ozone dosage of 2.9 +- 1.1 mg/liter (+-1 SD), the mean TOC reduction was 10.3 + 23.0% (+-1 SD). The TOC chromatgrams for all samples showed the predominance of one peak for the TOC in the molecular weight fraction of 1000 to 5000. Seasonal shifts in TOC patterns occurred as illustrated by the change in percentage of TOC in the <4000 apparent molecular weight group was found in the ozonated samples than in the raw water samples. This difference, which varied from 5 to 8%, reflected the effect of ozonation. A seasonal shift toward bromoform in the total trihalomethane production was observed, and ozonation accentuated the shift toward bromoform. Ozonation caused a decrease in the yields of allfour trihalomethanes. For Kaw Lake, water ozonation caused a greater reduction in total trihalomethanes than in TOC. Possible alteration of the precursors by ozonation could make them less amendable to trihalomethane formation. Preliminary results of this study have shown preozonation to have a limited effect in reducing the concentration of the more brominated trihalomethanes. The study is continuing because the potential overall effects of preozonation have not been fully evaluated. (Author)

Descriptors: *Water treatment, *Chemical treatment, Water treatment facilities, Legal aspects, Regulations, Drinking water, Potable water.

Various aspects of the Safe Drinking Water Act are discussed, with emphasis on maximum contaminant levels, and design consideration, including water source treatment selection. The focus of the treatment selection discussion is inorganic and organic chemical removal, turbidity, microbiological contaminants and radiological chemicals. The greatest difficulty will be for small communities to meet the requirements of the new law. Since cost effective water treatment processes for small water systems have never been fully developed, research in this area is badly needed. (Halterman-PTT)

Methods for establishing treatment requirements for specific water supplies, prior to the designing of a treatment plant, are detailed. The treatment processes of major concern are removal of turbidity, iron, manganese, color and H2S; treatment for tastes and odors; softening; and disinfection. To assist the design engineer, applicable water quality standards and their meaning are discussed. Methods for evaluating water sources are reviewed, with special emphasis on meaningful methods of data analysis. Appropriate bench-scale tests are discussed, emphasizing evaluation of jar test data (turbidity topogram) and direct filtration studies. Pilot studies are discussed in detail, including comments on flocculation, sedimentation and filtration. (Halterman-PTT)

Coagulation, the process for combining small particles into larger aggregates, is an essential component of accepted water treatment practice in which coagulation, sedimentation and filtration processes are combined in a series to remove particulates from water. The coagulation process, including destabilization and mixing, is outlined. The materials used for destabilization are described. They include hydrolyzing metal ions (primarily aluminum), synthetic polymers, and coagulant aids (such as activated silic). Some guidelines for proper selection of these materials are provided. Finally, rapid mix and flocculation tanks are discussed. Guidelines for their proper use are provided. (Halterman-PTT)

Descriptors: *Water treatment, *Chemical treatment, *Sludge utilization, Water treatment facilities, Turbidity, Flocculation, Water analysis, Sludge disposal, Sludge thickening.

The A.P. Black process for sludge removal entails pumping thickened sludge, produced from the lime-softening of hard, turbid or colored water, to a series of sludge carbonation cells where it is mixed with scrubbed kiln gas containing 20% CO2. The magnesium hydroxide is dissolved from calcium carbonate and turbidity factors. This slurry passes to a thickener from which clear supernatant containing soluble magnesium bicarbonate overflows and passes to a heat exchange unit and is warmed to 40 degrees C. After stirring, th precipitation of magnesium carbonate as the trih drate is rapid and complete in 90 seconds. Th turbidity factors are then removed by froth flot tion, and the purified CaCO3 is calcinated to high quality quicklime. The economics of th process are discussed and the application of th method under varying conditions is describe (Halterman-PTT)

PENDED SOLIDS REMOVAL,
nutit Co., Inc., Paramus, NJ.
R. T. O'Connell.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 283-298, 4 fig, 1 tab, 9 ref.

Descriptors: *Water treatment, *Suspended solids, Flocculation, Chemical treatment, Turbidity, Chemical coagulation, Treated water, Aluminum sulfate, Clarifiers, Filtration.

Ideally, a water treatment plant effluent should contain less than one turbidity unit. To attain this quality, a water treatment plant must be equipped with the proper unit process to remove suspended solids. The various compounds used for chemical coagulation are reviewed. Alum is the most widely used material. Ferrous sulfate and ferric sulfate are commonly used when a wide range of pH exists. The use of Bentonite clay, powdered activated carbon and polymers for aiding coagulation are described. Solids contact-sludge blanket units and filtration are also discussed. The estimated costs for capital equipment, including solids contact units, gravity filters, chemical feeds and controls are provided. (Halterman-PTT)
W86-02200

ADVANCED TECHNIQUES FOR SUSPENDED SOLIDS REMOVAL,
Neptune Microfloc, Inc., Corvallis, OR.
W. R. Conley, and S. P. Hansen.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 299-312, 9 fig, 2 tab, 10 ref.

Descriptors: *Water treatment, *Suspended solids, Flocculation, Chemical treatment, Turbidity, Chemical coagulation, Treated water, Aluminum sulfate, Clarifiers, Filtration.

Improved suspended solids removal, at a low cost, can best be achieved by precisely controlling coagulation. Advanced technology for doing so includes the use of a coagulant control center which continuously monitors coagulation conditions and alerts the operator to any changes. High-rate treatments (tube settlers, and mixed media filters) also help improve the system by reducing costs. The combination of these two modifications provides superior suspended solids removal at capitol costs lower than those of conventional water treatment plants. (Halterman-PTT)
W86-02201

PRECOAT FILTRATION,
Iowa State Univ., Ames. Dept. of Civil Engineering.
E. R. Baumann.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 313-370, 34 fig, 11 tab, 18 ref.

Descriptors: *Water treatment, *Suspended solids, Flocculation, Chemical treatment, Turbidity, Chemical coagulation, Treated water, Aluminum sulfate, Clarifiers, Filtration.

Precoat filtration, employing thin layer (3-5 mm) of filter media, requires three steps: a precoating operation, a filtering step, and a backwashing operation. This effective filtering procedure results in the loss of filter media after each run because it is quite difficult to separate the filter media from the solids that were removed. The entire operation is described, along with guidelines for selection of filter types, filter media, and filter media coatings. Various applications for precoat filtering are provided, including budgetary constraints, large seasonal variation in demand, and systems needing emergency or standby service. Optimal plant designs for precoat filtering are discussed. (Halterman-PTT)

DESIGN AND APPLICATION OF POTABLE WATER CHLORINATION SYSTEMS,
G. C. White.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 371-395, 1 fig, 10 ref.

Descriptors: *Water treatment, *Drinking water, *Chlorination, *Chlorine, Potable water, Bacterial analysis, Wastewater treatment, Residual chlorine.

The information necessary for the design of a chlorination system is provided, and the objectives of chlorination and its many uses in water treatment are outlined, and the means of achieving these objectives are discussed. Chlorination has historically been a method of choice for disinfection, taste and odor control, algal growth prevention, slime prevention, removal of iron and manganese, and organic color bleaching. The benefits of chlorination with hypochlorinators and gas chlorinators are compared. Injector systems, diffusers, mixing devices and safety equipment are discussed. (Halterman-PTT)

PUMP STATIONS,
Black and Veatch, Kansas City, MO.
J. R. Wright.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 397-414, 7 fig, 1 tab, 2 ref.

Descriptors: *Water treatment, *Water treatment facilities, *Pumping, Pumping plants, Pumping tests, Pumps, Drinking water, Potable water.

Since water must be pumped either from the source of supply to the treatment works, or from the treatment works into the delivery system, or both, the pumping facilities must be consistent with the treatment plant design concepts. General considerations to be made are structural, architectural, and the layout of the equipment. Pump selection is based on a variety of factors, including pump design, pump control systems, drive systems (gasoline, gas, diesel, electric), cavitation tendency, sump design, piping, and valves. The important specification criteria for pumping stations and some data on costs of pumping stations are provided. (Halterman-PTT)
W86-02204

PACKAGE WATER TREATMENT PLANTS,
Culp/Wesner/Culp, Shingle Springs, CA.
S. P. Hansen, and W. R. Conley.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 415-434, 7 fig, 4 tab, 6 ref.

Descriptors: *Water treatment, *Drinking water, *Water treatment facilities, Potable water, Coagulation, Flocculation, Filtration, Settling tanks, Sedimentation.

The package water treatment plant has become established as a practical and economic solution for providing treated water for small communities. The historical problems associated with these systems have been overcome with recent developments in flocculation, clarification, and filtration. Features that are available to continuously monitor filtered water turbidity and to prevent the introduction of poor quality water into the distribution system are discussed. Because of the economics of their construction, ease of operation and maintenance, and reliability, package plants should be carefully considered for flows of less than 5 mgd. (Halterman-PTT)
W86-02205

PACKAGE WATER TREATMENT EQUIPMENT,
Permutit Co., Inc., Paramus, NJ.
R. T. O'Connell.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 435-445, 5 fig, 2 tab.

Descriptors: *Water treatment, *Drinking water, *Water treatment facilities, Potable water, Coagultion, Flocculation, Filtration, Settling tanks, Sedimentation.

Package-type water treatment equipment (preassembled, modular treatment units) for removal of suspended solids are discussed, and examples of

treatment systems are detailed. The sludge blanket clarifiers, with horizontally mounted agitators, are well suited for the package-type unit concept because they are small, the internal parts can be readily fabricated, and the units require no welding. Steel-shell cylindrical gravity filters can be shipped partially preassembled. The two major types in use are the automatic valveless gravity filter and the steel shell, conventional style gravity filters. Two examples of system development are diagramed, showing raw water intake, chemical dosing for coagulation, agitation, and sludge filtration. Differences in the systems, with regard to filtration, are discussed. (Halterman-PTT)
W86-02206

INSTRUMENTATION FOR AUTOMATIC OPERATION,
R. H. Babcock.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 447-459, 2 fig, 3 tab, 9 ref.

Descriptors: *Water treatment, *Chemical treatment, *Water treatment facilities, Drinking water, Potablewater, Water analysis, Turbidity, Pollutants, Hydrogen ion concentration, Residual chlorine.

Automatic treatment systems have instrumentation that must control critical tasks, minimize tedious repetitive tasks, and provide a tool for process supervision. Critical areas are measurement of flow and level; analytical measurement and control (pH, turbidity, chlorine residual, fluoride and hardness); alarm systems; and the modulation of controls. The automatic control of treatment systems is becoming a major factor in the design of modern systems. (Halterman-PTT)
W86-02207

POTASSIUM PERMANGANATE FOR IRON AND MANGANESE REMOVAL AND TASTE AND ODOR CONTROL,
Carus Chemical Co., La Salle, IL.
K. J. Ficek.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 461-479, 10 fig, 2 tab, 20 ref.

Descriptors: *Water treatment, *Chemical treatment, *Drinking water, Potable water, Taste, Odor Control, Odors, Potassium permanganate, Chlorine.

Potassium permanganate can be used effectively and economically to reduce taste and odors and to oxidize iron and manganese. Because it is an oxidizing agent, potassium permanganate application prior to chlorination reduces the chlorine requirement. It can be used with other water treatment chemicals, such as carbon, to improve water quality. The normal dosage levels of potassium permanganate range from 0.5 to 2.5 mg/l, but higher dosages may be required for more highly contaminated waters. Finally, potassium permanganate is safe and easy to handle. (Halterman-PTT)
W86-02208

ACTIVATED CARBON FOR TASTE AND ODOR CONTROL,
Westvaco Corp., Covington, VA. Carbon Dept.
B. H. Kornegay.
IN: Water Treatment Plant Designfor the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 481-496, 12 fig, 9 ref.

Descriptors: *Activated carbon, *Water treatment, *Chemical treatment, *Drinking water, Potable water, Taste odors, Odor control, Filtration, Adsorbants, Carbon.

The history of the use of activated carbon is discussed, including its early use in the 1920s in the chemistry industry. Since that time, powdered activated carbon has become the most widely used method of taste and odor control. Comparative laboratory testing is the most effective method for evaluating the cost-effectiveness of various carbons, but, in the absence of these data, the iodine number should be used as the basis of selection. Granular activated carbon systems are increasing in number and may be more cost-effective for severe taste and odor problems. The carbon also serves as a filter medium when applied in conventional systems. Therefore, adsorption, filtration and backwash must be considered in design. (Halterman-PTT)
W86-02209

CHEMICAL CONDITIONING FOR WATER SOFTENING AND CORROSION CONTROL,
Brown and Caldwell, Walnut Creek, CA.
D. T. Merrill.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 497-565, 21 fig, 9 tab, 18 ref.

Descriptors: *Water treatment, *Chemical treatment, Drinking water, Potable water, Corrosion, *Corrosion control, Water softening, Water treatment facilities.

The use of Caldwell-Lawrence diagrams to analyze and solve corrosion control problems is described. The diagrams provide a means to assess rapidly and accurately the condition of raw and finished waters, the type and amount of chemicals required to produce the finished water, and the amount of chemical precipitates formed. Insights that are not generally available through the inspection of gross analytical parameters are obtained by the use of these diagrams. Examples of the use of these diagrams in rational analyses of water processing alternatives are provided. (Halterman-PTT)
W86-02210

LIME-SODA SOFTENING PROCESSES,
Greeley and Hansen, Chicago, IL.
C. W. Reh.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 567-596, 10 fig, 7 tab, 21 ref.

Descriptors: *Water treatment, *Chemical treatment, *Water softening, Drinking water, Potable water, Water treatment facilities, Water analysis.

The design of lime softening facilities for municipal plants involves the application of basic water chemistry to continuous, uninterrupted flow regimens to produce a finished water with desirable, consistent and predictable characteristics and properties. Lime-soda ash-caustic softening includes a number of flow patterns, a wide variety of equipment components, and accessory equipment for process control and sludge disposal. Alternate processes and bases for selection, process elements, specialized equipment and bases for selection, process elements, specialized equipment and tankage for the softening operations, and overall softening process control are discussed in detail. (Halterman-PTT)
W86-02211

ION EXCHANGE,
Montana State Univ., Bozeman.
R. L. Sanks.
IN: Water Treatment Plant Design for the Practicing Engineer, Ann Arbor Science, Ann Arbor, MI, 1982. p 597-622, 13 fig, 5 tab, 10 ref.

Descriptors: *Water treatment, *Ion exchange, Chemical treatment, Drinking water, Potable water, Anion exchange, Cation exchange, Resins.

Background information on ion exchange is provided to enable engineers to make preliminary designs, evaluate costs, optimize capital and operating costs, and to guide the manufacturer toward a final design that approaches the optimum. The properties of strong acid, weak acid, strong base, weak base, and intermediate (difunctional) base exchangers are discussed. The design procedure is outlined as follows: select the resin to be used, determine pretreatment requirements, select regenerant level, select the regeneration contact time, recheck the capacity of the resin as a function of the raw water analysis, recheck the capacity vs. the service flow rate, check the leakage of hardness cations, calculate backflow rate, determ pressure drop within the resin beds, and fina compute the operating cycle by determining time required for all operations and compute amount of water treated. Methods of making th determinations and for making estimates on costs of operating this system, are provided. (H terman-PTT)
W86-02212

WATER QUALITY IMPROVEMENT BY R VERSE OSMOSIS,
I. Nusbaum, and A. B. Riedinger.
IN: Water Treatment Plant Design for the Prac ing Engineer, Ann Arbor Science, Ann Arbor, 1982. p 623-652, 8 fig, 4 tab, 16 ref.

Descriptors: *Water treatment, *Drinking wa *Reverse osmosis, *Ultrafiltration, Potable wa Membrane processes, Filtration, Bacteria, Viru Radioactive wastes.

Reverse osmosis and ultrafiltration, two types pressure-driven membrane systems, are proce that are capable of water quality enhancem above and beyond that of conventional wa treatment. The term reverse osmosis usually plies to the separation of ionic or low molecu weight species from a solvent, usually water, b process involving osmosis. The molecular dim sions of the solute are within one order of mag tude of that of the solvent. Operating pressures reverse osmosis, as applied to dissolved solids c centrations of up to 10,000 mg/l, are usually in range of 300 to 600 psi. Ultrafiltration, on the ot hand, is a filtration process, utilizing a por membrane, which is used on bacteria, viruses colloidal and high molecular weight dissolved ganic substances. Several characteristics of reve osmosis are described to provide engineers with understanding of the operational requirements performance of these systems. Included in the cussion are concentration polarization; specific and compound rejection; effects of temperatu compaction, pH and total dissolved solids. Ap cations to removal of organic compounds, bacte viruses, pyrogens, radioactive substances and ga are detailed. (Halterman-PTT)
W86-02213

TECHNIQUES AND MATERIALS FOR PR VENTING CORROSION,
American Paint Journal Co., New York.
A. Banov, and H. J. Schmidt.
IN: Water Treatment Plant Design for the Prac ing Engineer, Ann Arbor Science, Ann Arbor, 1982. p 653-674, 6 tab, 6 ref.

Descriptors: *Water treatment, *Water treatme *Coatings, *Linings, Sealants, Epoxy resi Rubber, Elastomers, Zinc.

Because chemicals involved in water treatment a severe burden on surface materials, selection proper coating for surfaces is critical. Guidance selecting the proper coating for surfaces un mild service conditions are provided. Selection materials, surface preparation, application and spection techniques are outlined. A variety of co ings and linings are discussed, including acryli epoxies, fluorocarbons, chlorinated rubber, phe resins, polyesters, silicones, vinyls, urethanes, el tomeric urethanes, metalizing sealers, neopre chlorinated polyether, inorganic zinc, chloros fonated polyethylene, asphalt, rubber linings, c tar epoxy, and furane resins. Two highly ra combinations of coatings are (1) a urethane mo ture-cure primer, a two-component aromatic u thane intermediate coat, and a two-component phatic urethane topcoat, and (2) an inorganic z primer, a two-component epoxy/polymide int mediate coat and a high-build urethane topco (Halterman-PTT)

TER SUPPLY AND SANITATION IN DE-
OPING COUNTRIES,
Arbor Science, Ann Arbor, MI. 1982. Edited
Eric J. Schiller and Ronald L. Droste. 368 p.

riptors: *Water supply development, Devel-
g countries, *Sanitation, *Water treatment,
stewater treatment, Water supply, Public
h, Water resources development, Water man-
ent, Training, Economic aspects, Social as-
, Waste disposal, Project planning.

This book is a revised and improved version of the material from a course given at the University of Ottawa during June 1981. Planning for this course evolved from an International Development Research Center (IDRC)/Canadian International Development Agency (CIDA) man-power training project and workshops that were conducted in East and Southern Africa during 1978-1980. As a result of extensive cooperation with overseas personnel, the dual emphases of renewable energy technologies and social, management and economic aspects emerged. These two foci provide the main outline for this book. This book gives a comprehensive coverage of the technical and management aspects of implementing water supply and sanitation systems in developing countries. It should prove valuable for both technical and non-technical personnel who want to orient themselves to these activities. The text is divided into four sections. Section 1 deals with water supply technologies. Section 2 considers low-cost sanitation options. Section 3 deals with management aspects, and Section 4 discusses interfacing programs with developing countries. (Geiger-PTT)

WATER SUPPLY AROUND THE WORLD--APPROPRIATE TECHNOLOGY,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
D. A. Okun.
IN: Water Supply and Sanitation in Developing Countries, Ann Arbor Science, Ann Arbor, MI, 1982. p 9-21, 11 fig.

Descriptors: *Water supply development, *Developing countries, *Sanitation, *Water treatment, *Wastewater treatment, Water supply, Water resources development, Water management, Economic aspects, Waste disposal, Project planning, Automation, Capital costs, Labor.

While it is not likely that a community will opt for improved sanitation ahead of water supply, the commitment should be made to both at the same time. In developing countries, water supply and sanitation facilities are often not yet available to people in rural areas, villages and many urban areas. The principles on which water supply and sanitation facility design and operation are based are the same in developed and developing countries. The only difference is that in developing countries, the facilities may be more labor-intensive than capital intensive. Since water supply and wastewater collection and treatment facilities are often among the most expensive and prominant of all investments made by communities in developing countries, the most modern technologies are usually opted for, over less costly and usually more adequate conventional technologies. Not only does the use of excessive technology detract funds from higher-priority needs, but investment in this technology becomes a heavy liability. Examples of the use of inappropriate technology for water treatment in Africa and Asia are given. (Geiger-PTT)

REGIONALIZATION OF WATER SUPPLY AND SANITATION SERVICES,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
D. A. Okun.
IN: Water Supply and Sanitation in Developing Countries, Ann Arbor Science, Ann Arbor, MI, 1982. p 23-35, 1 fig, 6 ref.

Descriptors: *Regional development, *Water supply development, *Developing countries, *Sanitation, *Water management, Water supply, Water resources development, Training, Economic aspects, Social aspects, Political aspects, Wastewater facilities, Wastewater treatment, Waste disposal, Project planning, Wastewater disposal.

In 1945, the British initiated a program of regionalization of water supplies to optimize investments in water supply, wastewater collection and disposal, river regulation, and the amenity uses of inland waters. The uniqueness of water projects in relation to climate, precipitation, topography, density and distribution of population, industrial development, land use, economic status, availability of human resources, and social structure and customs must be recognized. The need for pure water supplies is important in developing countries where infectious diseases are more likely to spread. Integration of wastewater collection and disposal with water supply is particularly appropriate in arid and semiarid areas of the world where reclaimed wastewaters are used for nonpotable purposes. Integration of these services can afford efficiencies and economies of scale similar to those obtained by regionalization. When adopting a regionalization approach in developing countries, certain guidelines should be followed. The region should encompass people of the same cultural background. The region should be close to regional headquarters, or be large enough to have its own headquarters. The region should conform to political boundaries and should have potential for education and training centers, and be able to manage its own facilities. (Geiger-PTT)

In less developed countries, the general rule for water treatment is to provide the minimum treatment necessary. A good water source is the first protective barrier against waterborne disease. Microbiological quality is the major measure of the quality of water. Fecal coliform and streptococcus serve as indicator organisms of microbiological purity. In developing countries, nitrates can cause methemoglobinemia in infants under 3 months of age. Fluorides in moderate amounts are desirable to prevent dental caries. Other dissolved inorganic salts affect the taste of water and can cause a temporary laxative effect. Fe and Mn cause staining of fixtures and clothes and contribute taste and odors. In developing countries, operation and maintenance of water treatment plants is the responsibility of national or regional governments. Storage of water supplies offers additional protection against emergency water demands. Aeration, filtration and chlorination are common practices for the treatment of water. Sand filtration may be

incorporated into source protection by using an infiltration gallery. There are a number of simple chlorination devices that can be used if the supply of solid chlorine is assured. (Geiger-PTT)

SITING HAZARDOUS WASTE MANAGEMENT FACILITIES: THEORY VERSUS REALITY,
Boston Univ., MA. Dept. of Urban Affairs and Planning.
R. F. Anderson, and M. R. Greenberg.
IN: Hazardous and Toxic Wastes: Technology, Management and Health Effects, The Pennsylvania Academy of Science, Easton, PA. 1984. p 170-186, 2 fig, 6 tab, 29 ref.

Descriptors: *Water quality control, *Waste disposal, *Landfills, New Jersey.

A site screening method is useful in making decisions for locating new hazardous waste sites. Applied to 46 known disposal sites in Lower Raritan/Middlesex County 208 Water Management Area, central New Jersey, the method shows that most of these sites are not acceptable according to criteria in the proposed method. The 272 cells of 2 x 2 kilometers each were evauated according to 22 criteria, grouped into 9 composite statistical factors. Each cell rated 1-4 (most suitable to least suitable) in each of the 9 categories. A composite rating (1-5) was developed, 1 having the largest number of most suitable ratings and 5 having more than one least suitable ranking. Of the 38 most suitable cells, only 4 contain existing landfills. The other 42 landfills in this region, including the Kin-Buc landfill in Edison, are situated in land unsuitable for this purpose. ENVIRONMENTAL IMPACT OF POLLUTION CONTROLS ON THE THAMES ESTUARY, UNITED KINGDOM,
Thames Water Authority, Reading (England).
P. Casapieri.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 489-504, 4 fig, 4 tab, 11 ref.

Descriptors: *Water quality control, *Estuaries, *Management, *Thames River, *United Kingdom, Water pollution control, Water pollution sources, Dissolved oxygen, Oxygen, Legislation, Wastewater treatment, Aquatic habitats, Habitats, Fish, Salmon, Standards, Water quality standards, Rivers, Tidal rivers.

The Thames River Estuary, badly polluted with industrial and human waste since the 18 century, has been recovering in recent years. Dissolved oxygen levels started to improve about 1870, following pollution control legislation in 1857. However, starting about 1900, dissolved oxygen again decreased, reaching zero for the period 1940-1965. In 1973 the 1600 separate water authorities responsible for pollution control in England and Wales were reorganized into 10 regional water authorities. Environmental quality objectives were developed by the Pippard Committee. Beginning with dissolved oxygen goals (minimum of 1 mg/liter), the next step was a management strategy to establish dissolved oxyten levels suitable for a migratory fish habitat. Six classes of rivers were defined, each with water quality objectives and standards. Likewise, tidal waters were classified into five categories. One measure of water quality is the number of fish species recorded in the Key-Gravesend reach. This has increased from <5 in 1964 to 50 in the late 1960's to nearly 100 in 1980. A 17-year salmon introduction project started in 1979 has yielded salmon caught by rod and reel and by electrofishing. (Cassar-PTT)

Ditches, Leachates, Dewatering, Leaching, C
analysis, Waste disposal, Land disposal, Wa
dumps, Sanitary landfills, Case studies.

The methods of construction and some design c
siderations used during the installation of a lea
ate collection trench drain at a landfill in Conne
cut is described. The problems related to m
uniform soil conditions were remedied by u
finer till from other stockpiles onsite. Compact
was improved creating a temporary till dam acr
the trench to retain liquids long enough to all
till to be placed on the trench bottom. Permeabil
tests were lengthy and pre-testing of sites is reco
mended. Dynamite blasting at the site caused
sures through which leachate could travel.
epoxy sealant was applied to prevent leach
escape through fissures. The manholes at
bottom of downgradient barriers had to be
rounded with an impermeable barrier to prev
leakage from the system. The entire system, incl
ing a trunk line to connect the collection drain
the existing sanitary sewer, was installed for ab
$400,000. The sytem currently collects appro
mately 20,000 gpd, an amount which may decre
over time as the groundwater level drops. (Geig

Various alternatives available for remedial acti
(cleanup) of abandoned hazardous waste si
(which will generally be pits, barrel repositories
burial grounds) are considered. After a field inv

tigation has revealed the extent and type of contamination and sources of material (inventory), a judgment is made on the appropriate action. The alternatives to be considered include no action, site management, stabilization and closure, encapsulation, fixation, on site treatment, off-site secure landfill, or off-site treatment. The use of field tests, pilot studies, financial considerations, and assessment of risk of failure, to determine the most appropriate courses of action are discussed. (Halterman-PTT)

SLURRY TRENCH CUTOFF WALLS FOR HAZARDOUS WASTE ISOLATION,
D. J. D'Appolonia.
IN: Hazardous Waste Management for the 80's, Ann Arbor Science, Ann Arbor, MI, 1982. p 289-305, 12 fig, 2 tab, 2 ref.

Descriptors: *Trenches, *Waste management, *Design criteria, *Waste disposal, *Cutoffs, Solid wastes, Liquid wastes, Environment, Landfills, Leachates.

Soil-bentonite slurry trench cutoff walls are an effective tool for isolating chemical and industrial waste materials that are disposed of in landfills or ponds. They can provide a vertical barrier around a disposal site without uncovering or disturbing the waste. The geological conditions where slurry trench construction is most applicable are reviewed, as are the important elements of slurry trench design. Critical design considerations include the connection details between the cutoff and the underlying aquaclude and the blend of soils and bentonite used for the landfill. In order to obtain a low permeability , containment-resistant backfill, a high percentage of fine plastic material must be used. A clayey sand or sandy clay containing 30 to 60 percent fines blended with bentonite slurry is usually satisfactory for most waste isolation applications. (Halterman-PTT)

MONITORING, RECOVERY AND TREATMENT OF POLLUTED GROUNDWATER,
R. Quince, and G. L. Gardner.
IN: Hazardous Waste Management for the 80's, Ann Arbor Science, Ann Arbor, MI, 1982. p 357-369, 13 fig, 2 tab.

Descriptors: *Groundwater pollution, *Industrial wastes, *Water treatment, Environment, Groundwater recharge, Water quality, Biological treatment, Chemical treatment.

An overview of techniques currently applied to recover and treat polluted groundwater is presented. The process consists of several steps: A preliminary investigation of existing site conditions, selection of a method of recovery (usually gravity collection, suction lift or positive displacement), selection of a treatment system based on the contaminant(s) being recovered, use of treatment system effluent for aquifer recharge, and monitoring. Four case histories encompassing a variety of contaminants are presented to illustrate the procedure. Treatment steps can be divided into three primary classifications: physical, chemical and biological. Physical techniques employ phase or component separation. Chemical treatment techniques employ the addition of a reactive material to provide for a change in chemistry of the waste stream. Biological treatment uses enhanced mirobiological activity to convert contaminants to non-toxic by-products. In situ recovery and treatment techniques including biodegradation have proven more effective than excavation and disposal of contaminated material. (Halterman-PTT)

DRAINAGE AND SALINITY CONTROL PROGRAMS IN PAKISTAN,
International Bank for Reconstruction and Development, Washington, DC.
W. D. Fairchild.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 43-52.

Descriptors: *Saline water; *Salinity, Irrigation, Water requirements, Water supply, Water use, Water users, Economic aspects, Pakistan, Indus Basin, Groundwater.

Several salinity-related water sector programs in Pakistan are outlined and the similarities with the Colorado Basin situation are discussed. Pakistan has up to 1.6 megahectares underlaid with saline groundwater that fits their 'disaster' classification of having a continuous high water table of less than 1.5 meters. Recommendations concerning salinity control included: exploitation of fresh groundwater resources by the private sector; implantation of a program to transfer operation and maintenance of existing public tubewells in fresh groundwater zones to the private sector; and placing high priority on control of waterlogging in saline groundwater zones in future investment programs. (Halterman-PTT)

USDA PLANNING PROCESS FOR COLORADO RIVER BASIN SALINITY CONTROL,
Soil Conservation Service, Portland, OR. West National Technical Center.
H. D. Hedlund.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 63-77, 2 fig, 2 tab, 20 ref.

Descriptors: *Salinity, *Saline water, *Irrigation, *Irrigation procedures, Water requirements, Irrigation requirements, Water supply, Water use, Water users, Colorado River, Colorado River Basin.

Several aspects of the USDA program for salinity control in the Colorado River Basin are reviewed. The planning process consists of the following six major steps: define the problem (quantification of the salinity problem); inventory and analysis (inventory of on-farm practices and analytical procedures to evaluate conditions); formulate alternative plans (determination of possible treatment opportunities); prepare displays of effects and compare alternative plans (displays aid in identification of tradeoffs between alternatives); and select the recommended plan (includes consideration of acceptability by local farmers and ranchers and the obligation to meet national and international water conservation and interstate water quality goals). Several on-going programs, including the Wellton-Mohawk, Grand Valley and Vinta Basin, are discussed. (Halterman-PTT)
W86-02270

SALINITY BUBBLES AND OFFSETS: A CONCEPT PAPER,
Environmental Protection Agency, Denver, CO. Water Management Div.
G. R. Reetz.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 79-91, 30 ref.

Descriptors: *Salinity, *Saline water, Irrigation, Irrigation procedures, Water requirements, Irrigation requirements, Water supply, Water use, Water users, Colorado River, Colorado River Basin, Legal aspects, Legislation.

The impacts of salinity and the principles of a bubble/offset policy for environmental protection are discussed and the specifics of the problem of salinity in the Colorado River are described. Impacts on land and water uses include reduced crop yield, additional municipal water treatment costs, and increased corrosion and wear at water treatment facilities. The bubble concept applies to the practice of a facility rearranging emission control requirements, decreasing controls where control costs are high in exchange for increased controls where costs are low. The offset policy permits a new facility to enter a non-attainment area, provided the firm offsets its emissions with emission reductions obtained from existing firms in the non-attainment area. As related to Colorado River salinity control, the state of California recommended a bubble (the salinity concentrations at a particular time) bounded by the outflow from the Upper Basin, and recommended a basinwide offset policy for maintaining the bubble. The flexibility of the bubble and offset concepts, and their appropriateness for controlling salinity in the Colorado River Basin are discussed.
W86-02271

PLANNING AND IMPLEMENTATION FRAMEWORK FOR SALINITY CONTROL IN THE INDUS RIVER BASIN,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.
M. S. Shafique, and G. V. Skogerboe.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 93-102, 3 fig, 1 tab, 5 ref.

Descriptors: *Saline water, *Salinity, Irrigation, Water requirements, Water supply, Water use, Water users, Economic aspects, Pakistan, Indus River, Groundwater.

The planning phase of salinity control in the Indus River Basin, Pakistan, included several steps. First, evaluation of alternatives for each individually irrigated area leads to practices that can effectively control salinity resulting from the use of water for irrigation. The second step is to define the best management practices by optimizing the cost-effectiveness relationships from individual areas into a single strategy. The third step assigns the required level of salinity control that should be implemented in each subbasin or irrigated area. The role of farmer organizations, monitoring, and evaluation in assuring the effectiveness of ongoing programs are discussed. (Halterman-PTT)

IMPROVING WATER MANAGEMENT PRACTICES ON SURFACE IRRIGATED LANDS: THE ROLE OF MODELING,
Utah State Univ., Logan. Dept. of Agricultural and Irrigation Engineering.
W. R. Walker.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston, 1984. p 203-211, 4 fig, 1 tab, 13 ref.

Descriptors: *Salinity, *Saline water, *Irrigation, *Water quality control, Model studies, Irrigation design, Irrigation efficiency, Irrigation practices, Irrigation return flow.

Some of the faulty modeling assumptions made about uniform application of irrigation water, and the resultant bias of the results which favor off-farm salinity control options, are discussed. The need for more realistic irrigation models is stressed, and state-of-the-art models are described. Hydrodynamic, zero-inertia, kinetic-wave and volume balance models are outlined. Several ways in which surface irrigation models can be helpful are discussed. For instance, after an on-farm salinity control measure has been implemented at a structural level, the model can be used in conjunction with other management tools to improve and maintain effective irrigation practices. The use of surface irrigation models to predict the use of surge flow, cablegation, cutback, or tailwater reuse systems is also discussed. (Halterman-PTT)

SKIMMING WELL MODEL FOR SALINITY CONTROL,
California Univ., Davis. Dept. of Civil Engineering.
B. A. Chandio, and B. E. Larock.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 235-242, 3 fig, 7 ref.

Descriptors: *Salinity, *Saline water, *Groundwater, *Water quality control, Model studies, Irrigation practices, Well hydraulics, Well water, Shallow water, Skimming.

A three-dimensional miscible fluid model of transient unconfined flow toward a skimming well is described and the role of such a model in salinity control is discussed. The ability to predict or control the distribution of salinity with skimming wells depends on knowledge of the hydromechanics of flow near the well. Important geometric factors that effect the hydromechanics, and thus the well operation, are described. Various well-operation strategies, such as depth and duration of pumping, can be tested for a suitable set of geometric parameters. In this way, the optimum means of skimming water from the relatively thin band of fresh groundwater which overlies a thicker saline water layer in an unconfined aquifer, can be determined. However, owing to the use of linear elements in the model, computations employing a larger, finer mesh of elements is suggested. (Halterman-PTT)

CASE STUDY OF A SALINITY CONTROL PROGRAM, VINTA BASIN, UTAH,
Soil Conservation Service, Salt Lake City, UT.
H. T. Brown.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 275-284, 1 fig, 1 tab, 6 ref.

Descriptors: *Salinity, *Saline water, Groundwater, Irrigation, Irrigation effects, Irrigation practices, Environmental effects, Economic aspects, Agricultural hydrology, Agriculture, Vinta Basin, Utah.

Poor irrigation practices and natural salt sources resulted in increased total dissolved solids entering streams near irrigated lands. Technical assistance from the Soil Conservation Service and the Agricultural Stabilization and Conservation Service was initiated, at a cost of about $0.5 million per year, to control the salinity problem. Pasture management, irrigation water management, wildlife habitat management, land leveling and reservoir regulation are included in the salinity control program. It is estimated that 69,475 metric tons of salt-loading from the irrigated area can be eliminated from the Colorado River system annually. On-site benefits, including lower operating costs and higher crop yields, are also discussed. (Halterman-PTT)

Descriptors: *Salinity, *Saline water, Groundwater, Irrigation, Irrigation effects, Irrigation practices, Environmental effects, Economic aspects, Agricultural hydrology, Agriculture, Colorado River.

In order to improve groundwater flows and reduce salt loading, a 6.8 mile length of the Government Highline Canal was lined with concrete, and cross-drainage facilities were installed. To assess the effectiveness of these improvements, a hydrologically-closed basin, known as the Reed Wash study area, has been equipped to monitor surface and groundwater inflows, outflows, and levels. A monitoring program, implemented to establish preconstruction hydrologic conditions and to observe the effects of canal lining and lateral piping on salt loading in the watershed, is discussed. The monitoring program indicates that the water system improvements have been effective in reducing seepage and salt loading from canals and laterals. This area will be monitored for a number of years to verify the effectiveness of the lining program. (Halterman-PTT)

MEASURES FOR REDUCING RETURN FLOWS FROM THE WELLTON-MOHAWK IRRIGATION AND DRAINAGE DISTRICT,
Bureau of Reclamation, Boulder City, NV. Lower Colorado Region.
R. J. Effertz, W. K. Sidebottom, and M. D. Turley.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 305-314, tab.

Descriptors: *Salinity, *Saline water, Groundwater, Irrigation, Irrigation effects, Irrigation practices, Environmental effects, Economic aspects, Agricultural hydrology, Agriculture, Colorado River.

A variety of measures to reduce salt loading of the Colorado River are discussed. Acreage reduction, on-farm measures and technical assistance are stressed. Research projects that added to irrigation efficiencies and reduction in drainage water included monitoring soil salinity; preventing clogging of emitters in trickle irrigation systems; managing dead-level irrigation; automating surface irrigation; and evaluating economic aspects of alternative irrigation systems. Reduced irrigation acreage and on-farm improvements resulted in significant reductions in the drainage of saline waters into the Colorado River. (Halterman-PTT)

CONTROLLING SALINITY IN THE COLORADO RIVER BASIN, THE ARID WEST,
Bureau of Reclamation, Denver, CO. Colorado River Water Quality Office.
A. R. Jonez.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 337-347, 3 fig, 5 ref.

Descriptors: *Saline water, *Salinity, *Water quality control, Irrigation, Water use, Irrigation effects, Irrigation practices, Environmental effects, Agriculture, Colorado River, Desalination.

The sources of salt in the Colorado River are discussed. The primary sources are natural (47%), irrigation (37%) and reservoir evaporation (12%). Several activities designed to reduce salt loading and salinity levels in the Colorado River are discussed. They include irrigation source control (land leveling and canal sealing), point source control (removal of salt from localized areas such as mineral springs, abandoned oil wells, and geysers), diffuse source control (watershed management, land treatment and the collection and disposal of irrigation return flows). Major issues and concerns pertaining to salinity control are discussed, and the need for further development in salinity control technology is stressed. (Halterman-PTT)

SALINITY CONTROL BY PUMPING AND DEEP WELL INJECTION - THE PARADOX VALLEY UNIT,
Bureau of Reclamation, Durango, CO.
E. G. Jensen, and R. W. Leach.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 349-358, 6 fig

Descriptors: *Saline water, *Salinity, *Water quality control, Groundwater, Water supply, Colorado River, Colorado, Dolores River, Environmental effects, Well hydraulics, Economic aspects, Hydraulics.

A plan to reduce salinity inputs to the Dolores River, a tributary of the Colorado River, is discussed. The Dolores River picks up an estimated 205,000 tons of salt annually as it passes over a salt anticline in Paradox Valley, Colorado. A control plan which has been adopted involves pumping brine from wells paralleling the Dolores River and adjacent to brine inflow areas. The pumping will lower the freshwater-brine interface below the river channel, thus preventing the brine from entering the river. Brine disposal methods have not been selected; however, disposal in large evaporation ponds, or by deep-well injection, appear to be the most attractive alternatives. (Halterman-PTT)

SALINITY CONTROL BENEFITS THROUGH REGULATION OF PRODUCED WATER,
Utah Bureau of Water Pollution Control, Salt Lake City.
J. R. Riding.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 367-375, 1 tab, 26 ref.

Descriptors: *Saline water, *Salinity, *Water quality control, Groundwater, Water supply, Environmental effects, Well hydraulics, Deep wells, Ponds, Water pollution, Groundwater pollution.

Methodologies are discussed by which 'produced' water (from oil and gas production) is disposed, and salinity loading is minimized. The use of evaporation ponds and injection wells have long been standard practices; however, the need has existed for more stringent regulations regarding these two methods. Regulations recently developed for pond disposal insure that with proper siting, design, construction, and monitoring, minimal ground water contamination will take place. Successful disposal by injection well can be attained if water is injected into formations that are below freshwater zones, and separated from them by impermeable layers to prevent the upward migration of the injected fluids. (Halterman-PTT)
W86-02298

ARKANSAS-RED RIVER BASINS CHLORIDE CONTROL PROJECT: TECHNICAL FEASIBILITY STUDIES FOR PLAN OF CONTROL,
Corps of Engineers, Tulsa, OK.
H. H. Roberts.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 377-387, 8 fig, 1 tab, 2 ref.

Descriptors: *Saline water, *Salinity, *Water quality control, Groundwater, Water supply, Environmental effects, Well hydraulics, Deep wells, Ponds, Water pollution, Groundwater pollution.

A summary of the chloride contamination problem in the Arkansas and Red River Basins is provided, and an overview of technical feasibility studies necessary to develop a control plan is presented. The source of the salt is thick deposits of halite under a large area of the southwestern United States. Salt loading into the Arkansas and Red River Basins has degraded the waters to such a degree that they are unusable for most purposes. Surface water investigations indicate that three separate salt emission areas exist in a study area along Jonah Creek, a tributary of the Red River. Groundwater pump tests have shown that they are also separate hydrologically. Brine collection and disposal methodologies are discussed. The most efficient techniques involve pumping brine to the surface and then disposing of it by means of deep well injection. (Halterman-PTT)
W86-02299

GLENWOOD-DOTSERO SPRINGS SALINITY CONTROL PROJECT,
URS Co., Denver, CO.
D. A. Macko.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 389-396, 1 fig, 1 tab.

Descriptors: *Saline water, *Salinity, *Water quality control, Groundwater, Water supply, Environmental effects, Well hydraulics, Economic aspects, Colorado River, Drainage wells.

Various aspects of a proposed salinity control project, including planning, field investigations, results, and the conclusions, are discussed. The results of the field investigation were used in the design and cost estimates for the components of the recommended plan. Data indicate that a well field could collect approximately 0.20 cu m saline water/sec from the subsurface without dilution from the Colorado River. A computer model was calibrated with aquifer test data and extensive modeling efforts were undertaken to design a well that would not impact upon several nearby commercial springs. Annual reductions in salinity and water depletion rates that would result from the implementation of the recommended plan are discussed. (Halterman-PTT)

SALINITY CONTROL ON THE SMOKY HILL RIVER IN CENTRAL KANSAS,
Kansas State Geological Survey, Lawrence.
C. D. McElwee, A. Fleming, M. Butt, and A. Severini.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 397-406, 7 fig, 2 tab, 5 ref.

Descriptors: *Saline water, *Salinity, *Water quality control, Model studies, Groundwater, Water supply, Well hydraulics, Drainage wells, Relief wells, Smoky Hill River, Kansas.

The possible use of relief wells to alleviate the problem of high salinity in the Smoky Hill River is discussed. Modeling methods are applied to evaluate the effectiveness of various systems. Results indicate that the volume of salt water leakage could be reduced by 20%. In some cases, regional flow can capture about 50% of the freshwater leakage induced by the relief wells, resulting in considerable dilution of the discharged water. The most efficient net effect of the relief-well systems modeled was a reduction of 77-85% in the salt load discharged to the alluvium. The model predicts, however, that most of the dilution effect will not be felt at the discharge area for 40-160 years. (Halterman-PTT)

FISH AND WILDLIFE MITIGATION PROGRAM FOR THE COLORADO RIVER BASIN SALINITY CONTROL PROJECT - A CASE HISTORY,
Bureau of Reclamation, Boulder City, NV. Lower Colorado Region.
T. A. Burke, D. E. Busch, and W. E. Rinne.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 539-548, 1 tab, 2 ref.

Descriptors: *Saline water, *Salinity, Mitigation, Wildlife conservation, Fish conservation, Arizona, California.

Salinity control measures impact upon fish and wildlife in a variety of ways, including: loss of surface water and associated wetlands in and along the lined canals due to elimination of seepage; loss of vegetation for project rights-of-way; and loss of irrigated croplands in the Wellton-Mohawk area (retired from agricultural use). The development of mitigation strategies designed to offset these, and other losses, are outlined. General mitigation measures include: use of existing main outlet drains as a conveyance channel for salt water wastes; screening the feed water intake to the desalting plant to reduce fish loss; conducting fish salvage during canal dewatering works, and providing bridges, siphons, and escape ladders in and along the canals for both human and wildlife use. Specific mitigation projects for both Arizona and California are detailed. (Halterman-PTT)

TRIANGLE CONSERVATION DISTRICT - A CASE STUDY IN DRYLAND SALINE SEEP CONTROL,
Triangle Conservation District, Conrad, MT.
T. Dodge, J. Holzer, W. Adams, and J. Farkell.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 561-570, 2 fig, 1 tab, 6 ref.

Descriptors: *Salinity, *Saline water, *Seep water, Seepage control, Seeps, Percolation, Environmental effects, Wells, Montana.

Saline seeps, defined as recently developed saline soils in non-irrigated areas, that are wet some or all of the time, are discussed. Control of seeps is obtained by a variety of techniques, including selective crop growth, and pumping ground water out of localized seeps, thus lowering the water table. Farm-by-farm assistance for saline seep control is the quickest and best way to solve the problem. Developing a successful saline plan requires a combination of the 'ideal' solution and practical considerations--economics, land ownership, farm program participation, type of farm operation, etc. Effective saline seep control frequently alters the entire farm operation. The changes in management require technical assistance throughout the implementation stage by a team of agronomic and soil specialists. (Halterman-PTT)

PROCESS OF PROJECT PREPARATION,
Walker and Partners Ltd., Ottawa (Ontari).
B. Grover.
IN: Water Supply and Sanitation in Developing Countries, Ann Arbor Science, Ann Arbor, MI, 1982. p 269-285, 2 fig, 6 ref.

Descriptors: *Project planning, *Sanitation, *Water supply development, *Decision making, *Feasibility studies, Future planning, Evaluation, Planning, Financing, Management planning, Financial feasibility, Water supply, Projections, Benefits.

The basic factors involved in the preinvestment planning of water supply and sanitation development projects are reviewed. A brief report suffices to identify a possible project and commence the preinvestment planning. The prefeasibility study aims to select a preferred project for near term implementation after considering longer-term needs, existing system deficiencies and alternative system development. International financing agencies normally require general data on how the water supply and sanitation sector is organized throughout the country, and on how effectively services are currently provided and on national goals concerning water supply and sanitation services. The rationale for proceeding to develop a project must be explained carefully. Separate plans should be prepared for the phased development of water supply and sanitation systems to meet projected needs in the project area throughout the planning period. The prefeasibility stage should reach certain conclusions and recommend future actions, including the preparation of selected projects in a comprehensive feasibility study. The feasibility stage is the last stage before a project is approved and funds are committed. The feasibility report should provide data on the proposed project, institutional and financial aspects, and project impacts and justification. Resources for project preparation are discussed. Project approval usually depends on the consensus of several interest groups. (Geiger-PTT)

The 20-year evolution of the cost-sharing rationale of the control of chlorides from natural sources is discussed. The financing involves several levels of the Federal government and the particular states that are involved. The major factors that influence any cost-sharing rationale include precedents (sim larity of project to others with established co sharing policies), national objectives, state of t economy, recent laws or policies, and the logic the new cost apportionment proposal. Specific m ural sources of salt that are discussed include t Arkansas and Red Rivers and the Brazos Riv basin. The general cost-sharing rationale is summ rized as follows. From 1961-1963, 100% of chl ride control was paid for by the Federal Interst Water Quality Project. In following years, t federal government paid from zero to 75% costs. In 1977-1980, 100% of costs were paid non-federal government agencies. In recent yea the federal government has provided substanti reimbursements to non-federal agencies. (Halte man-PTT)

COST-EFFECTIVE WATER SUPPLY AN SANITATION PROJECTS FOR DEVELOPIN COUNTRIES,
International Bank for Reconstruction and Deve opment, Washington, DC. Dept. of Transportatio and Water.
F. L. Golladay.
IN: Water Supply and Sanitation in Developi Countries, Ann Arbor Science, Ann Arbor, M 1982. p 221-249, 2 fig, 3 tab, 1 ref, 3 appen

Descriptors: *Cost analysis, *Cost-benefit analysi *Water supply development, *Sanitation, *Deve oping countries, Economic aspects, Project pla ning, Water supply, Costs, Econometrics, Ec nomic evaluation.

This chapter suggests how needs for water suppl and waste disposal can be met as sharply reduce costs. The economist is charged with the respons bility of cost-effectiveness and cost-benefit analys of development projects. The value of benefits generally difficult to quantify. The accounting costs is usually incomplete. The value attached inputs frequently bears little relationship to the social opportunity costs. Where surface water uncontaminated and continuous, it offers the lea costly option for water supply. Groundwater su plies are inexpensive when they can be drawn b hand with rope and bucket. The major issue urban water supply projects is the type of deliver system to be installed. Waterborne sewerage pr vides not only health and environmental benefit but very high consumer convenience. Examples least-cost analyses of water supply and sanitatio systems are presented. The initial choice of tec nology to improve sanitation should also refle the desire for future improvements. The purpose determining economic costs is to provide the bas for meaningful least-cost comparisons among alte natives. Unless substantial subsidies are feasibl low income consumers can afford only the chea est of the low-cost options. A government mig attach top priority for sanitation development areas where the burden of disease is greatest. Ap pendices dicuss the use of shadow pricing in co analysis, costs of alternative water supply and san tation service levels, and alternative service leve for urban water supply. (Geiger-PTT)

FINANCING WATER SUPPLY SYSTEMS,
North Carolina Univ. at Chapel Hill. Dept. Environmental Sciences and Engineering.
D. A. Okun.
IN: Water Supply and Sanitation in Developin Countries, Ann Arbor Science, Ann Arbor, M 1982. p 251-267, 6 fig, 10 ref.

Descriptors: *Economic aspects, *Water supply *Financing, *Water costs, *User charges, Cos analysis, Water supply development, Sanitation Developing countries, Project planning, Costs Economic evaluation.

Financing of a system of water supply by the user is needed to provide the user with a sense of the value of the system and help assure its proper operation and maintenance. The income will help defray at least the cost of operation and maintenance and provide funds for expansion of the system as needed. If local participation in financing is needed to assure success of a water supply project, then local initiative and collaboration in the planning and implementing of the project should also be included. Methods of collection of fees for water include residential metering, and metering at roadside standpost water supplies. Another less costly option that may delay metering is the use of flow restrictors or Fordillas. Water vending by individuals or by the government is often practiced in cities and villages not served by piped systems. Financing affects the design of water supply systems in terms of facility size and the availability of funds for capital and manpower in the face of massive needs. If a long-term and continuing investment in water supply and sanitation systems is to be assured for those curently being served and for the large percentage of the population not yet being served, financing systems need to provide sufficient funds, not only for payment of current operation and maintenance costs, but for repayment of capital costs. 6D. Water Demand

WATER USE IN OHIO, 1980,
Geological Survey, Columbus, OH. Water Resources Div.
M. Eberle, and J. A. McClure.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4024, 1984. 35 p, 5 fig, 7 tab, 28 ref.

Descriptors: *Water use, Industrial water, Thermal powerplants, Municipal water, Livestock, Rural areas, *Ohio.

An estimated 13,389 million gallons of water per day were used in Ohio in 1980, in four major categories of water use. Of this total, 12,645 Mgal/d (million gallons per day) were taken from surface-water sources whereas 744 Mgal/d was ground water. Totals for each category (in Mgal/d) were: thermoelectric power generation, 10,417; self-supplied manufacturing, 1,399; public water supplies, 1,432; and rural domestic and livestock, 41. Additional miscellaneous uses (irrigation, rural commercial, and non-manufacturing industrial) probably totaled about 300 Mgal/d. The five counties that led the state in total water use were: Jefferson, 2,620 Mgal/d; Lucas, 1,150 Mgal/d; Mahoning, 1.086 Mgal/d; Cuyahoga, 1,085 Mgal/d; and Lorain, 991 Mgal/d. These counties, in the same order, were the top five surface-water users. (USGS)

ESTIMATE OF SELF-SUPPLIED DOMESTIC WATER USE IN OKLAHOMA DURING 1980,
Geological Survey, Oklahoma City, OK. Water Resources Div.
C. D. Stoner.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 83-4223, 1984. 20 p, 7 fig, 4 tab, 7 ref.

Descriptors: Water supply, *Water utilization, Domestic water, *Oklahoma, *Water use.

Reported or measured water-use data for the domestic self-supplied user were not available for the state of Oklahoma; therefore, estimates of water use within this classification were derived. The total self-supplied population in Oklahoma during 1980 was estimated at 343,615, which was 11.4 percent of the total 1980 State population. The rate of water use by this group was estimated to be 56 gallons per capita per day. For 1980, the estimated annual domestic self-supplied water use by county ranged from 10 to 1,180 acre-feet, with a total statewide use of 21,610 acre-feet. (USGS)

WHAT IS THE MOST EFFECTIVE WATER POLICY FOR THE UNITED STATES: NATIONAL DEBATE TOPIC FOR HIGH SCHOOLS, 1985-1986,
Library of Congress, Washington, DC. Congressional Research Service.
Pursuant to Public Law 88-246, Senate, 99th Congress: 1st Session, Document No. 99-2, 1985. 957 p, 169 ref.

Descriptors: *Planning, *Water law, *Water policy, *Water supply, *Water quality, Federal jurisdiction, Water resources development, Water management, Institutional constraints, Water rights, Legal aspects, Water transfer, Wastewater treatment, Potable water, Drinking water.

Resource material for a national debate topic for high schools (1985-1986) consists of published papers, a bibliography, and guide to information sources, including government publications. The book is divided into chapters on background materials and the three debate propositions: (1) Resolved: that the federal government should implement a national system of priorities to control the allocation of all water in the United States, (2) Resolved: that the federal government should establish a comprehensive national policy to protect the quality of water in the United States, and (3) Resolved: that the federal government should establish a national policy to insure each United States resident an adequate supply of potable water for personal use. (Cassar-PTT)

LEGAL AND INSTITUTIONAL CONSTRAINTS TO SALINITY CONTROL,
Bureau of Reclamation, Provo, UT. Utah Projects Office
J. Franson, and M. Lopez.
IN: Salinity in Watercourses and Reservoirs, Butterworth Publishers, Boston. 1984. p 55-61, 6 ref.

Descriptors: *Salinity, *Saline water, Irrigation, Irrigation procedures, Water requirements, Irrigation requirements, Water supply, Water use, Water users, Colorado River, Colorado River Basin.

A variety of constraints to salinity control in the Colorado River are reviewed. General constraints that are discussed include the local perception that salinity control benefits only the lower Colorado Basin at the expense of the upper Basin, and, the perception by the federal government that the problem is regional and should be solved by the Basin states. Further constraints that are discussed include a lack of urgency at both the local and national level, and a lack of coordination in funding between the Bureau of Reclamation and the Soil Conservation Service. Possible options for slowing down the projected increases of salinity concentrations are discussed. They fall into three categories: prevent saline waters from entering the River, reduce salt pickup of waters entering the River, and provide extra water for dilution of salinity.

EVALUATION OF COMMUNITIES FOR THE APPLICATION OF LIMITED-DETAIL STUDY METHODS FOR FLOOD-INSURANCE STUDIES,
Geological Survey, Reston, VA. Water Resources Div.
E. D. Cobb.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 85-4098, 1985. 54 p, 3 fig, 3 tab.

Descriptors: *Floods, *Flood discharge, Flood plain management, *Flood profiles, *Flood routing, Maps, Insurance, *Flood insurance, Data collections, *Data program design, *Limited-detail flood-insurance studies, Historical floods, Depth-frequency studies, Evaluations.

The U.S. Geological Survey evaluated 2,349 communities in 1984 for the application of limited-detail flood-insurance study methods, that is, methods with a reduced effort and cost compared to the detailed studies. Limited-detail study methods were found to be appropriate for 1,705 communities, while detailed studies were appropriate for 62 communities and no studies were appropriate for 582 communities. The total length of streams for which limited-detail studies are recommended is 9,327 miles with a corresponding cost of $23,007,000. This results in average estimated costs for conducting limited-detail studies of $2,500 per mile of studied stream length. The purpose of the report is to document the limited-detail study methods and the results of the evaluation. (USGS)

6G. Ecologic Impact Of Water Development

APPEARANCE AND WATER QUALITY OF TURBIDITY PLUMES PRODUCED BY DREDGING IN TAMPA BAY, FLORIDA,
Geological Survey, Tampa, FL. Water Resources Div.
C. R. Goodwin, and D. M. Michaelis.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Supply Paper 2192, 1984. 66 p, 47 fig, 20 tab, 41 ref.

Descriptors: *Estuaries, *Dredging, *Water quality, *Aerial photography, *Florida, Turbidity, Nutrients, Metals, Pesticides, *Tampa Bay, *Turbidity plumes.

Turbidity plumes in Tampa Bay, Florida, were photographed and sampled during ship-channel dredging operations from February 1977 to August 1978 to document plume appearance and water

quality. Color photographs depict plumes ranging in length from tens of meters to several kilometers with turbidity levels from less than 10 to 200,000 Nephelometric Turbidity Units. Sediment composition varied from 85 percent sand and shell to 60 percent silt and clay. Plumes from one hopper dredge and three cutterhead-pipeline dredges were investigated. Disposal methods included beach nourishment, stationary submerged discharge, oscillating surface discharge, and creation of emergent dikes using turbidity barrier containment. Tidal velocities ranged from zero to 0.60 meters per second. Primary turbidity plumes were created directly by dredging and disposal operations and secondary plumes were created indirectly by resuspension of previously deposited material. The most visible turbidity plumes resulted from surface discharge to unconfined disposal areas of material having relatively high sand content discharging during times of strong tidal currents. Changes were not detected in nutrient, metal, and pesticide concentrations in Tampa Bay due to dredging. Few long-term turbidity characteristics of Tampa Bay could be directly attributed to dredging operations. (USGS)

PROJECTING LAND USE CHANGES ASSOCIATED WITH SMALL WATERSHED DEVELOPMENT,
Economic Research Service, Washington, DC. Natural Resource Economics Div.
J. Kasal, and W. Crosswhite.
Available from the National Technical Information Service, Springfield, VA 22161 as PB83-149427, Price codes: A03 in paper copy, A01 in microfiche. ERS Staff Report No. AGES820330, April 1982. 47 p, 5 fig, 8 tab, append.

Descriptors: *Small watersheds, *Land use, *Projections, *Water resources development, *Statistical methods, Aerial photography, Markov process, Mathematical studies, Evaluation, Project planning.

This study determines if projected land use changes and their benefit estimates are biased in favor of project development. Both the base period land use estimates and the projected land use changes in a sample of 40 projects in two contrasting geographical regions were found to be reliable. When observed land use changes are measured from aerial photographs, the differences between projected and observed land use changes were not statistically significant. Four alternative land use projection techniques - aerial photography, trend analysis, cooperative river basin study procedures and the Markov process - did not improve upon the reliability of the U.S. Department of Agriculture Soil Conservation Service (SCS) land use projections. The SCS land use projection procedures for small watershed areas are set forth in the Economics Guide. Farm surveys are used to collect land use data for planning and evaluation of small watershed projects. The SCS land use projection procedures provide reliable measures of land use trends for estimating land use benefits due to project measures. (Geiger-PTT)

PATTERNS IN PREHISTORIC SETTLEMENT: EXAMINING THE DISTRIBUTION OF SITES IN A PORTION OF THE COLORADO RIVER VALLEY,
New World Research, Inc., Tucson, AZ.
Report of Investigations No.83-11, 1984. Compiled by John E. Keller, and L. Janice Campbell. Bureau of Reclamation, Amarillo, TX. 259 p, 64 fig, 23 tab, 6 app, 137 ref.

Descriptors: *Environmental effects, *Water resources development, *Archeology, Columbus Bend Dam, *Texas, Colorado River, Colorado Coastal Plains Project.

A cultural resources investigation of the proposed Columbus Bend Dam and Reservoir in Colorado and Fayette counties, Texas, revealed 96 sites. These were dominated by prehistoric lithic scatters. Lithic-ceramic scatters, stratified prehistoric sites, and historic sites were also identified. The work produced a predictive model of site location and interpretation of site data in light of cultural patterns and influences in settlement. (Cassar-PTT)

INDIAN LAND USE AND OCCUPANCY IN THE FRANKLIN D. ROOSEVELT LAKE AREA OF WASHINGTON STATE,
R. Bouchard, and D. Kennedy.
Colville Confederated Tribes, Nespelem, WA. June 1984. 456 p, 129 fig, 234 ref.

Descriptors: *Environmental effects, *History, *Land use, Indians, Franklin D. Roosevelt Lake, Washington, Columbia River.

Indian land use and occupancy were studied in Franklin D. Roosevelt Lake, Washington, the area along the Columia River between Grand Coulee Dam and the Canadian border. Elderly Indian informants and archives yielded 408 place names. For each place name are given the associated legends, meaning of the name, and activities. A comprehensive history of land utilization in Sanpoil, Spokane, Colville, and Lakes Indian territories traces events starting with the fur trading era. Information about hunting, fishing, plant food gathering, intergroup relations and territories is most abundant for the Sanpoil people. Little details are available for the Lakes and Colville peoples. However, some generalizations, common to all fishing-hunting-gathering people, can be made. (Cassar-PTT)
W86-01992

POTENTIAL CONSEQUENCES OF REJECT STREAM REPLACEMENT PROJECTS ON AQUATIC, TERRESTRIAL, AND RECREATION RESOURCES: VOLUME II, AQUATIC RESOURCES,
Engineering-Science, Inc., Arcadia, CA.
U.S. Bureau of Reclamation, Boulder City, NV. February 1980. 219 p, 33 fig, 21 tab, 4 append.

Descriptors: *Environmental effects, *Wildlife, *Fish, *Aquatic habitats, Yuma Desalting Plant, Butler Valley, Arizona, Imperial Valley, California, Alamo River, Salton Sea, All-American Canal, Santa Clara Slough, Aquatic plants, Aquatic animals, Aquatic life, Habitats, Marshes, Salt marshes, Canals, Rivers, Invertebrates, Streams, Brines, Desalination.

Effects on aquatic resources are discussed for several proposed projects for replacing the 44,000 acre-feet/year of brine flow rejected from the Yuma Desalting Plant. Proposed locations for these projects are the Imperial Valley, California, or Butler Valley, Arizona. Water systems affected by the projects include the All-American Canal, Alamo River, Salton Sea, Santa Clara Slough, and Butler Valley. For each system the following were determined: channel features, hydrology, water quality, substrates, underwater cover, and aquatic life (fish, algae, macrophytes, invertebrates, amphibians, and reptiles). The All-American Canal, impacted only in the 43.5-mile reach from Pilot Knob to East Highline Canal, supports a large gamefish population which is not widely fished. The Alamo River is not a good fishery, because of a small fish populaiton and concern over bacterial and pesticide contamination. The saline Salton Sea at Wister has only three macroinvertebrates (pile worms, barnacles, and amphipods) and three gamefish species. The Santa Clara Slough, a small salt marsh, contains 14 species of salt water fish and a variety of fish-eating birds. The Butler Valley in Arizona has no perennial streams or standing waters, only desert washes. Groundwater is abundant at depths of 100-500 feet. (Cassar-PTT)
W86-01994

CLASS III SURVEY OF THE TUCSON AQUEDUCT PHASE A CORRIDOR, CENTRAL ARIZONA PROJECT: AN INTENSIVE ARCHAEOLOGICAL SURVEY IN THE LOWER SANTA CRUZ RIVER BASIN, PICACHO RESERVOIR TO RILLITO, ARIZONA,
Arizona State Museum, Tucson. Cultural Resource Management Div.
Archaeological Series 165, January 1984. Compiled by Jon S. Czaplicki. 286 p, 136 fig, 64 tab, 201 ref, 5 append. 0-07-30-X0091.

Descriptors: *Environmental effects, *Archeology, Water resources development, Right-of-way, Aqueducts, *Central Arizona Project, *Tucson Aqueduct, *Arizona, Aqueducts, Santa Cruz River.

A Class III intensive survey of 42 miles (about 9753 acres) of Phase A of the Tucson Aqueduct, Central Arizona Project, was conducted between June 7 and October 15, 1982. Seventy-eight prehistoric and eight historic sites were recorded. Twenty-one of the prehistoric sites are Archaic sites or are sites with an Archaic component. These sites, in addition to numerous isolated projectile points, indicate a potentially extensive Archaic occupation of the study area. The 57 Hohokam sites include three Classic period communities, one in each reach and each one apparently centered on a platform mound complex. The platform mound on Brady Wash in Reach 1 lies just outside the aqueduct right-of-way. Several Preclassic sites were also identified in Reaches 1 and 2, including a reservoir in Reach 2. The 1982 survey identified a previously undocumented Archaic occupation and a much more extensive Preclassic and Classic Hohokam occupation in the Lower Santa Cruz River Basin north of Tucson and south of Florence, Arizona. This area had received relatively little attention by archaeologists until the investigation carried out as a result of construction of the Tuscon Aqueduct. (Author)
W86-01995

POTENTIAL CONSEQUENCES OF REJECT STREAM REPLACEMENT PROJECTS ON AQUATIC, TERRESTRIAL, AND RECREATION RESOURCES: VOLUME III, TERRESTRIAL RESOURCES.
Engineering-Science, Inc., Arcadia, CA.
U.S. Bureau of Reclamation. Boulder City, NV. February 1980. 329 p, 23 fig, 15 tab, 4 append.

Descriptors: *Environmental effects, *Vegetation, *Wildlife, Habitats, Mammals, Birds, Reptiles, Amphibians, Plant populations, Yuma Desalting Plant, Butler Valley, *Arizona, Imperial Valley, *California, Alamo River, Salton Sea, All-American Deserts, Arid lands, Brines, Desalination.

Effects on terrestrial resources are discussed for several proposed projects for replacing the 44,000 acre-feet/year of brine flow rejected from the Yuma Desalting Plant. Proposed locations for these projects are the Imperial Valley, California, or Butler Valley, Arizona. Vegetation and wildlife characteristics are reported for both areas. The Imperial Valley has nine types of communities from wetlands and river riparian to cresote bush and sand dunes. The animal population (54 species of mammals, 297 species of birds, 42 species of reptiles and amphibians) features several special interest birds and reptiles. The major concern is the rare black rail and the endangered Yuma clapper rail, which would be severely threatened by the wetlands elimination. The mammal population is comprised of few game mammals but many furbearers and rodents. Waterfowl are abundant. Butler Valley is a sparsely settled, productive desert community is the most attractive wildlife habitat. Five endangered or threatened wildlife species are found in the Butler Valley: peregrine falcon, desert bighorn, zone-tailed hawk, desert tortoise, and Gila monster. Ten species of blue list birds (not endangered in the study area, but scarce in other areas of the U.S.) live in this valley. (Cassar-PTT)

LARGE-SCALE OPERATIONS MANAGEMENT TEST OF USE OF THE WHITE AMUR FOR CONTROL OF PROBLEM AQUATIC PLANTS, REPORT 2: FIRST YEAR POSTSTOCKING RESULTS,
Florida Game and Fresh Water Fish Commission, Orlando.
S. Hardin, R. Land, G. Morse, and M. Spelman.
Volume II: The Fish, Mammals, and Waterfowl of Lake Conway, Florida, Technical Report A-78-2, February 1982. Report 2 of a Series. Army Engineer Waterways Experiment Station, Vicksburg, MS. 70 p, 15 fig, 9 tab, 55 ref, append. DACW39-76-C-0081.

Descriptors: *Aquatic weed control, *Aquatic weeds, *Biological control, White amur, Fish diets, Waterfowl, Aquatic mammals, Lake Conway, Florida.

Fish, waterfowl and wading birds, and aquatic mammal populations on Lake Conway, Orange County, Florida were surveyed for one year after the introduction of the herbivorous fish, white amur (Ctenopharyngodon idella). Fish populations were sampled by Wegener ring, seine, gill nets and electrofishing. Standing crop estimates were made with blocknet and rotenone collections. The sportfishery was measured by creel surveys. Waterfowl were observed and counted from an airboat, and collected by shotgun. Aquatic mammals were collected by a variety of traps. Low water levels reduced littoral zone area, which lead to stunted panfish and poorer condition of largemouth bass. Vegetated samples supported more diverse fish populations than beach sites. White amur and migratory waterfowl consumed the same plant foods; continued reduction of submerged plants by white amur may adversely affect overwintering waterfowl populations. Aquatic mammals were influenced by removal of vegetation due to shoreline development. (Author's modified abstract)

LARGE-SCALE OPERATIONS MANAGEMENT TEST OF USE OF THE WHITE AMUR FOR CONTROL OF PROBLEM AQUATIC PLANTS, REPORT 2: FIRST YEAR POSTSTOCKING RESULTS,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
D. L. Crisman, and F. M. Kooijman.
Volume III: The Plankton and Benthos of Lake Conway, Florida, Technical Report A-78-2, November 1981. Report 2 of a Series. Army Engineer Waterways Experiment Station, Vicksburg, MS. 1 p, 28 fig, 4 tab, 22 ref.

Descriptors: *Aquatic weed control, *Aquatic weeds, *Biological controls, White amur, Phytoplankton, Zooplankton, Lake Conway, Florida, Benthic fauna.

After the stocking of Lake Conway, Florida, with white amur to control aquatic vegetation, studies of the effects on plankton, benthos and zooplankton were conducted. Major fluctuations in plankton, benthos and zooplankton communities confounded the determination of the effects of white amur introduction. Further long-term studies are needed to determine the effectiveness and overall impact of introducing white amur for macrophyte control. The results are based on analyses of data on physical-chemical parameters, plant pigments, and abundance and species composition of phytoplankton, zooplankton and benthic macroinvertebrates. ASSESSING AND MANAGING EFFECTS OF REDUCED FRESHWATER INFLOW TO TWO TEXAS ESTUARIES,
National Coastal Ecosystems Team, Slidell, LA.
N. A. Funicelli.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 435-446, 2 tab, 7 ref.

Descriptors: *Enviromental effects, *Estuaries, *Management, *Filtration, Coastal zone management, Wildlife, Fish, Nutrients, Marshes, Floods, Nueces River, Corpus Christi Bay, Matagorda Bay, Rivers, Saline water, Aquatic habitats, Habitats, Organic carbon, Phosphorus, Nitrogen, Deltas, Wastewater disposal, *Texas.

While a major objective of coastal zone management plans is to maintain the value and use of estuaries, decisions affecting inflow, a critical component of estuaries, are often based on considerations of water use inland. The functions of estuaries as filters for inland based signals is often ignored. For effective manaagementof both inlandwater resources and estuarine freshwater inflow, methods for assessing the actual effects of inland perturbations are needed. Because no single method exists, the U.S. Fish and Wildlife Service used a set of evaluative methods to assess the effects of reduce freshwater inflow on estuaries in Nueces-Corpus Christi and Matagorda Bays and to develop management plans for ensuring fish and wildlife productivity. The set included (1) studying the effects of environmental changes on key species, (2) regression analysis between inflow and fishery harvest data, (3) compilation and analysis of a nutrient budget, and (4) comparison of historical and projected deltaic marsh inundations. Proposed management plans to address the findings of these assessment methods involved the release of freshwater during spring and low inflow, the rerouting of selected wastewater to the river delta, and the diversion of in-channel water to inundate deltaic marshes. These plans all depend upon compromises between inland and coastal needs. (Author)

DETERIORATION OF COASTAL ENVIRONMENTS IN THE MISSISSIPPI DELTAIC PLAIN: OPTIONS FOR MANAGEMENT,
Louisiana Universities Marine Consortium, Chauvin.
D. F. Boesch, J. W. Day, and R. E. Turner.
IN: The Estuary as a Filter, Academic Press, Orlando, FL. 1984. p 447-466, 2 fig, 1 tab, 34 ref. 14-16-0009-81-1016.

Descriptors: *Environmental effects, *Estuaries, *Deltas, *Management, *Mississippi River, *Louisiana, Channeling, Wetlands, Marshes, Canals, Dredging, Coastal zone management, Aquatic habitats, Habitats, Saline water, Water diversion, Sediment transport.

Coastal environments in the Mississippi Deltaic Plain of southeastern Louisiana are undergoing rapid change as a result of natural decay of Mississippi delta lobes, channelization of river flow, and dredging activities. As a result, over 100 sq km per year of coastal wetlands are converted to open water or uplands--85% of the total U.S. loss rate. Of the options available to reduce the deterioration of coastal wetlands, management of new delta accretion and regulatory control and rehabilitation of channelized wetlands are likely the most effective. Attempts to stabilize coastal barriers should also be made because of the potential for very rapid erosion in their absence. Controlled diversions of the river above the active deltas will be limited in capacity by the presence of populated areas and roads are unlikely to contribute significantly to new wetland accretion. Descriptors: *Environmental impact statement, *Tilapia, *Bass, Environmental effects, *Pumping plants, *Food chains, Fish, Fish populations, Water resources development, Water quality, Ecological effects, Fisheries, Rivers, Lakes, Eagles, Birds.

During operation of the Central Arizona Project (CAP) which is designed to deliver allocated Colorado River water to central and southern Arizona, fish will be pumped from Lake Havasu to central Arizona receiving waters. The life history characteristics of three fish species, water quality aspects of CAP source and receiving waters, the existing fisheries of CAP sources and receiving waters, physical features of pumping plants, and some life history phenomena of the southern bald eagle are documented. Striped bass and blue tilapia may have an adverse impact on the existing fishery of Lake Pleasant. These two species and the white bass are suspected of having an adverse impact on the ecology of the Salt and Verde Rivers. If blue tilapia enter Lake Pleasant, they will likely survive and reproduce while striped bass will be much less likely to reproduce. Recruitment by introduction would continue to occur. If these fish become established and their numbers are not controlled by predators or environmental pressures, they could have an impact on the fish food base of the southern bald eagles along these rivers. MORMON CARTER CLASS III CULTURAL RESOURCE SURVEY,
Bureau of Reclamation, Denver, CO. Lower Missouri Region.
S. R. Bradley, and M. Musitelli.
September 1984. 103 p, 53 fig, 28 ref, 2 append.

Descriptors: *Environmental effects, *Archeology, Mormon Carter Transmission Line, Fryingpan River, Colorado, Water resources development, Water transfer.

The Lower Missouri Region of the Bureau of Reclamation conducted a Class III cultural resources survey of the Mormon Carter Transmission Line in the North Fork Fryingpan River drainage, Pitkin County, Colorado. Four prehistoric sites and three historic sites were recorded during the survey. Manifestations of cultural behavior resulting from a lifeway of prehistoric, seasonal resource exploitation are contrasted to the manifestation resulting from a historic sedentary adaptation. The presence of a possible Rose Spring Corner Notched projectile point indicates human utilization of the North Fork drainage from at least

300 A.D. to the present. Five sites are recommended for avoidance or mitigation. The possible presence of subsurface deposits at these sites suggests eligibility to the National Register of Historic Places. (Author)

7A. Network Design

EVALUATION OF THE SURFACE-WATER DATA NETWORK, SUWANNEE RIVER BASIN, FLORIDA, 1982,
Geological Survey, Tallahassee, FL. Water Resources Div.
R. P. Rumenik, and J. E. Coffin.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4245, 1984. 22 p, 5 fig, 2 tab, 17 ref.

Descriptors: *Surface waters, *Gaging stations, *Water management, Flow characteristics, River forecasting, Flood profiles, Low flow, *Florida, *Suwannee River basin, Surface-water data network.

In the 9,950 square mile area of the Suwannee River basin in Florida and Georgia, a network of 33 surface-water gaging stations operated for different periods of time from 1927 to 1982 was evaluated for its capability to provide program information for floodplain mapping, floodplain management, forecasting of flow extremes, and defining the impact of changes in land use on surface-water quantity and quality. Gaging stations are classified based on the type of data and number of years record as current use, long-term trend, and planning and design. Goals are established for each classification. Suggestions for program revisions include establishing crest-stage gages for high-flow and flood-profile data, defining and establishing a low-flow network, and establishing two and discontinuing one daily discharge station. GROUND-WATER-QUALITY MONITORING NETWORK DESIGN FOR THE SAN JOAQUIN VALLEY GROUND-WATER BASIN, CALIFORNIA,
Geological Survey, Sacramento, CA. Water Resources Div.
W. E. Templin.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Inbvestigations Report 83-4080, 1984. 133 p, 19 pl, 7 fig, 6 tab, 131 ref.

Descriptors: Groundwater, Water quality, *Network design, Geology, Land use, *Water pollution sources, *Nonpoint pollution sources, Groundwater levels, *Groundwater quality, *Groundwater pollution, *California, Point sources, San Joaquin Basin, Tulare Basin, Sacramento-San Joaquin Delta, Pesticides (DBCP), Pesticides, Regional network design.

This report proposes ideal and actual ground-water-quality monitoring networks for the San Joaquin Valley basin, California. The report outlines an ideal network, comprising several subnetworks, to provide direction in development of actual networks composed of wells currently (1981) known to be monitored. The ideal network serves as a basis for future expansion of the actual networks as more wells are included in the inventory of active monitoring networks. The managment objectives of these networks are to develop a general baseline of ground-water quality, to identify trends in ground-water quality, and to identify sources of contamination. The networks are based on an information structure that includes land use, surface and subsurface geology, ground-water levels, surface- and ground-water quality, possible sources of contamination, and active ground-water-quality monitoring networks. Development of the categories and subcategories of network objectives, which are needed to describe the quality of ground water in the basin, make clear the inadequacy of the currently operated networks. The expansion of ground-water-quality monitoring in the San Joaquin Valley, therefore, would be necessary to approximate the objectives of the ideal network. (USGS)

COST-EFFECTIVENESS OF THE U.S. GEOLOGICAL SURVEY STREAM-GAGING PROGRAM IN ARKANSAS,
Geological Survey, Little Rock, AR. Water Resources Div.
M. E. Darling, and T. E. Lamb.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4084, 1984. 91 p 10 fig, 13 tab, 23 ref.

Descriptors: *Surface water records, *Statistical analysis, Gaging, Gaging station, Network, Streamflow, *Stream gaging, *Arkansas, *Cost-effectiveness.

This report documents the results of the cost-effectiveness of the stream-gaging program in Arkansas. Data uses and funding sources were identified for the daily-discharge stations. All daily-discharge stations were found to be in one or more data use categories, and none were candidates for alternate methods which would result in discontinuation or conversion to a partial record station. The cost for operation of daily-discharge stations and routing costs to partial record stations, crest gages, pollution control stations as well as seven recording ground-water stations was evaluated in the Kalman-Filtering Cost-Effective Resource allocation (K-CERA) analysis. This operation under current practices requires a budget of $292,150. The average standard error of estimate of streamflow record for the Arkansas District was analyzed at 33 percent.

ANNUAL AVERAGE CLIMATIC MAPS OF THE UNITED STATES,
National Climatic Data Center, Asheville, NC.
Environmental Information Summaries, C-21, September 1983. 10 p, 4 ref.

Descriptors: *Mapping, *Maps, *Climatology, *Meteorological data collections, *United States, Hydrologic maps, Precipitation, Relative humidity, Humidity, Solar radiation, Corrosion control, Data collections, Weather data collections, Dewpoint, Thunderstorms.

Several annual average climatic maps of the United States prepared by the National Climatic Data Center are presented. The maps may be applied to areas of allergy studies, corrosion protection requirement determinations, agriculture, and general climatology. Average annual map presentations in this edition are: temperature, 1941-1970; total precipitation (water equivalent), 1941-1970; relative humidity, generally 1948-1977; dew point temperature, generally 1946-1965; annual average daily global solar radiation on a south facing surface, generally 1953-1975; mean annual number of thunderstorms, generally 1948-1977; and normal annual heating degree days (contiguous United States and Alaska), generally 1951-1980. These climatic maps reflect average atmospheric conditions that occur over periods of years. Often, observed conditions for any given year will differ significantly from those indicated in the analyses. Caution should be used in interpolating on these generalized maps as sharp changes may occur in short distances, particularly in mountainous areas, due to differences in altitude, slope of terrain, type of soil, vegetation cover, bodies of water, air drainage, urban heat effects and other effects. Upon examination of mapped data, sulfur oxide emission densities were found to be correlated with corrosion potential. (Geiger-PTT)

EVALUATION OF THE CREST-STAGE GAG PROGRAM IN LOUISIANA,
Geological Survey, Baton Rouge, LA. Water R sources Div.
R. A. Herbert, D. D. Carlson, and G. J. Wiche.
Available from OFSS, USGS, Box 25425, Lak wood, CO 80225. USGS Water-Resources Invest gation Report 84-4204, 1985. 24 p, 11 fig, 9 tab, ref.

Descriptors: *Network analysis, *Network desig Crest gages, Annual runoff, Peak flow, Desig floods, Index stations, Regression analysis, *Floo frequency, *Flood recurrence interval, Floo peak, Annual-peak discharge, Crest-stage gage Flood-frequency equations, *Louisiana, Pine Hil Region.

The crest-stage gage program in Louisiana w evaluated to determine if the data were adequat for use in developing regional flood-frequenc equations and to determine if any crest-stage gag could be discontinued. An abundance of data many crest-stage stations and a lack of data fo urban area and flat-slope areas indicated a need fo a shift in the number, type, and locations of gage Extensive correlations and comparisons of annu peak flows and watershed characteristics of 96 sit resulted in a reduced network of 25 stations th could potentially be used as index sites. The ade quacy of the reduced network for developmen and verification of regional flood-frequency equ tions was tested by comparing a set of region flood-frequency equations developed using da from the full network with a set developed usin data from the reduced network. The results ind cate that the crest-stage gage network can be re duced to 25 stations and still provide adequat information for future flood-frequency analyse (USGS)

escriptors: *Network design, *Gaging stations,
treamflow, *Streamflow measurement, *Multi-
urpose networks, California.

method for evaluating the relative worth of
dividual streamflow gaging stations in a multipu-
se network is presented. Each individual gaging
ation in the network is evaluated on the basis of
lected rating factors. The factors relate to the
ed for information at the gaging stations, accura-
of data, economic aspects of operation, and
efulness of data as a basis for estimates at un-
ged sites. The total score for the various factors
ovides a convenient basis for comparing relative
portance of individual gaging stations. The
ting-factor method is both flexible and definitive,
t the point values that are assigned for each
ting factor are somewhat subjective. A table of
e point values and guidelines for assigning those
lues is presented. (USGS)

**RELINE-ROTARY AIR CORING OF THE
NDELIER TUFF, LOS ALAMOS, NEW
EXICO,**
ological Survey, Lakewood, CO. Water Re-
rces Div.
E. Teasdale, and R. R. Pemberton.
ailable from OFSS, USGS, Box 25425 Lake-
od, CO 80225. USGS Water-Resources Investi-
ons Report 84-4176, 1984. 9 p, 4 fig, 3 ref.

criptors: Drilling, *Coring, *Air-rotary drill-
Disturbed geologic samples, Undisturbed geo-
c samples, Sampling, *Wireline coring, Core-
nodifications.

s paper describes experiments using wireline-
ry air-coring techniques conducted in the Ban-
er Tuff using a modified standard wireline
e-barrel system. The modified equipment was
d to collect uncontaminated cores of unconsoli-
ed ash and indurated tuff at Los Alamos, New
tico. Core recovery obtained from the 210-foot
p test hole was about 92 percent. A standard
-size, triple-tube wireline core barrel (designed
the passage of liquid drilling fluids) was modi-
for air coring as follows: (1) Air passages were
ed in the latch body part of the head assembly;
(2) the inside dimension of the outer core barrel tube was machined and honed to provide greater clearance between the inner and outer barrels; (3) oversized reaming devices were added to the outer core barrel and the coring bit to allow more clearance for air and cuttings return; (4) the eight discharge ports in the coring bit were enlarged. To control airborne-dust pollution, a dust-and-cuttings discharge subassembly, designed and built by project personnel, was used. (USGS)

STATION NETWORKS FOR STORM OBSERVATION,
National Weather Service, Sterling, VA. Test and Evaluation Div.
K. E. Wilk, and S. L. Barnes.
IN: Thunderstorms: A Social, Scientific, and Technological Documentary. Volume 3: Instruments and Techniques for Thunderstorm Observation and Analysis, April 1982. p 1-31, 24 fig, 2 tab, 47 ref.

Descriptors: *Thunderstorms, *Meteorological data collections, *Radar, *Networks, *Data acquisition, Network design, Data collections, Weather data collections, Remote sensing, Reviews, Storms, Computers.

This chapter reviews the development of mesometeorological research networks and their instrumentation, and outlines some modern methods for data acquisition and analysis. The Thunderstorm Project in the 1940's was the first major national effort to collect data on thunderstorms. In 1955, the U.S. Army Signal Corps sponsored a reanalysis of the Thunderstorm Project and the data collection network was expanded. In the 1950's, the National Severe Storms Project (NSSP) was initiated within the U.S. Weather Bureau. In the early 1960's, the Air Force Air Weather Service and the Weather Bureau expanded their jointly operated Severe Local Storms Forecast Center to anticipate squall line development. Rapid improvement in research radars in the mid-1960's pointed the way to continuous, quantitative observations of storm development. By 1975, several low-cost devices became available to provide telemetry of analog data from remote sites to a central facility. By 1981, semiautomatic and automatic archiving and retrieval of meteorological data sensed at surface stations had become a standard practice. The objective map analysis method, a computerized method for analysis of spatially distributed time series observations, is described. The method is applied to surface, and upper-air data collected at an NSSP laboratory in central Oklahoma. (Geiger-PTT)

OBSERVATIONS FROM INSTRUMENTED AIRCRAFT,
National Oceanic and Atmospheric Administration, Boulder, CO. Weather Modification Program Office.
J. McCarthy, and D. L. Veal.
IN: Thunderstorms: A Social, Scientific, and Technological Documentary. Volume 3: Instruments and Techniques for Thunderstorm Observation and Analysis, April 1982. p 47-76, 18 fig, 1 tab, 43 ref.

Descriptors: *Thunderstorms, *Radar, *Aircraft, *Aerial photography, *Meteorological data collections, Remote sensing, Lightning, Storms, Computers, Data acquisition, Storms, Weather data collections, Data collections.

Several major aircraft facilities exist which devote part of their efforts towards understanding the thunderstorm. Aircraft can serve as a direct in situ probe of thunderstorms whereas radar is indirect. Sensors that can be mounted on the aircraft are those that measure temperature, humidity, pressure, and air velocities. Observations of the cloud droplet spectrum are made by impactor sampling, optical devices, and electrostatic disdrometers. Liquid water content is calculated by summation of drop size spectrum or by direct bulk measurement techniques using evaporators, optical flow meters, transmissometers, microwave radiometers, paper tapes, synthetic filaments, and hot-wire total water indicators. Raindrop-sized hydrometeors can be measured by foil impaction, optical devices and momentum sensing. Ice crystals are collected by Formvar replication, on oil-coated slides, or are studied by optical techniques. Airborne radar can provide the aircraft crew with immediate thunderstorm data. Airborne computer-directed data systems are usually designed to operate for data acquisition, self-check or preflight-postflight program, and data processing. Chaff from aircraft has been used for radar jamming and lightning suppression. Examples are presented of cases where instrumented aircraft data have been combined with other direct and remote sensors to yield valuable data on thunderstorms. (Geiger-PTT)
W86-02005

PHOTOGRAMMETRY OF THUNDERSTORMS,
National Oceanic and Atmospheric Administration, Boulder, CO. Weather Modification Program Office.
R. L. Holle.
IN: Thunderstorms: A Social, Scientific, and Technological Documentary. Volume 3: Instruments and Techniques for Thunderstorm Observation and Analysis, April 1982. p 77-98, 10 fig, 29 ref.

Descriptors: *Thunderstorms, *Clouds, *Photogrammetry, *Aerial photography, *Meteorological data collections, Photography, Data collections, Weather data collections, Storms, Tornadoes, Aircraft, Data acquisition.

Photogrammetry of every transient feature in thunderstorms is possible, but can be tedious. Mathematical equations which are used in conjunction with photogrammetry for determining cloud features are given. The simplest photographs of clouds are still photos taken by hand-held cameras. The next simplest system is the time-lapse movie camera which is usually focused on developing cloud systems. Panoramic photographs of the sky at fixed intervals provide benchmarks of cloud evolution in every direction from a single location. Multiple time-lapse camera photography of thunderstorms can be taken from either one or several locations with cameras usually unattended. Stereoscopic photographs afford a qualitative distance to clouds without any analysis. Analysis of airborne photos is more difficult than for those taken at ground level. Cloud maps can be developed from aircraft photos with the aid of lines drawn to connect the flight track to specific clouds when they are perpendicular to the side cameras and when they are at the azimuths corresponding to their entering, or leaving the side camera's view. Techniques for measuring widths and heights of clouds, and techniques for obtaining pictures from above thunderstorms are also discussed. (Geiger-PTT)
W86-02006

OBSERVATION AND MEASUREMENT OF HAILFALL,
National Center for Atmospheric Research, Boulder, CO. Convective Storms Div.
G. M. Morgan.
IN: Thunderstorms: A Social, Scientific, and Technological Documentary. Volume 3: Instruments and Techniques for Thunderstorm Observation

and Analysis, April 1982. p 149-180, 15 fig, 3 tab, 70 ref.

Descriptors: *Hail, *Networks, *Measuring instruments, *Remote sensing, *Weather data collections, Thunderstorms, Network design, Precipitation, Data acquisition, Radar, Meteorological data collections, Data collections, Tornadoes.

Techniques for measuring hailfall have undergone rapid improvements in the past 25 or 30 years through the introduction of simple but effective instruments in well-designed networks. The wind that accompanies hail has a strong influence on crop damage because it can impart a velocity component to the hailstone several times that acquired through free fall alone. For some purposes, volunteer observer networks of hailfall which were introduced 100 yr ago, are still useful today. Types of hail measuring or recording instruments in use today include the hailpad, hailcube, geophone hail gage, Illinois State Water Survey hail gage, hail-rain separator, time-resolving hail recorder, hailstone spectrometer, chilled-kerosene hailstone freezer, electro-optical hail recorder, hailstone sensor, and remote-sensing devices (radar). In developing hailfall observation networks, the ratio between the area of the hailstreak and the area represented by one grid point should be obtained for a sample of hailstreaks that represent the range and distribution of hailstreaks to be expected in the network. The size of the network determines the number of study events available each year and the number of instruments required to monitor them. (Geiger-PTT)
W86-02007

WEATHER RADAR,
National Severe Storms Lab., Norman, OK.
R. J. Doviak, D. Sirmans, and D. Zrnic.
IN: Thunderstorms: A Social, Scientific, and Technological Documentary. Volume 3: Instruments and Techniques for Thunderstorm Observation and Analysis, April 1982. p 181-239, 24 fig, 92 ref.

Descriptors: *Radar, *Remote sensing, *Data acquisition, *Meteorological data collections, *Measuring instruments, Data collections, Weather data collections, Tornadoes, Storms, Cyclones.

A foundation of weather radar principles is given and related to the target's meteorological properties. Subjects such as light scattering properties of hydrometeors and extracting a target's properties from its echoes are reviewed. Radar parameters and echo power are related to the weights given to a hydrometeoric target's backscatter cross section. The radar signal path starting from the transmitter is followed through the antenna, along the beam to the target, and return to the receiver, highlighting along the way the important signal properties. The pulsed Doppler radar is discussed and a discrete target to develop radar principles and the radar equation are considered. The theory for conventional non-Doppler radar is also included. These principles are then extended to the more complex weather target, which is a conglomerate of discrete targets producing a continuous stream of echoes with rapidly fluctuating amplitude and phase. The origin of these fluctuations is demonstrated and the weather radar equation is developed. The weather Doppler spectrum and its principal moments are related to the spatial distribution of target reflectivity and its velocity. Example analyses of radar data from severe storms are presented. (Geiger-PTT)
W86-02008

MEASURING STORM RAINFALL BY RADAR AND RAIN GAGE,
National Severe Storms Lab., Norman, OK.
E. A. Brandes, and J. W. Wilson.
IN: Thunderstorms: A Social, Scientific and Technological Documentary. Volume 3: Instruments and Techniques for Thunderstorm Observation and Analysis, April 1982. p 241-277, 13 fig, 4 tab, 90 ref, 1 append.

Descriptors: *Radar, *Remote sensing, *Rain gages, *Data acquisition, *Comparison studies, Measuring instruments, Data collections, Weather data collections, Rainfall, Gages, Storms, Meteorological data collections.

Radar overcomes the primary difficulties associated with rain gages; radar measurements are over an area, available in real time, and from a single location. The cost of radar is similar to that of a dense rain gage network. Rain gages are simple, less costly, but often erroneous in their measurements. Instrument errors and areal errors of rain gages are described. The radar equation and calculation of rainfall rate are described. Factors causing errors in radar measurement of rainfall may be grouped into three broad categories: estimating of radar reflective factor; time and space averaging of substantial variations in reflectivity; and variations in the reflectivity-rainfall rate (Z-R) relationship and below-beam effects. A comparison of areal radar and gage measurements was made in nine experiments using one average relationship for all storms. The very large storm-to-storm and within storm errors in radar rainfall estimates dictate that estimates should be adjusted further. Adjustments usually involve either specifying the Z-R relationship by storm type or keeping the Z-R relationship fixed and using rain gage observations to correct the radar estimates. (Geiger-PTT)

USE OF SATELLITE OBSERVATIONS,
National Oceanic and Atmospheric Administration, Boulder, CO. Weather Modification Program Office.
R. A. Maddox, and T. H. VonderHaar.
IN: Thunderstorms: A Social, Scientific and Technological Documentary. Volume 3: Instruments and Techniques for Thunderstorm Observation and Analysis, April 1982. p 279-308, 22 fig, 52 ref.

Descriptors: *Satellite technology, *Thunderstorms, *Data acquisition, *Radiometry, *Weather data collections, Radar, Remote sensing, Storms, Weather modification, Meteorological data collections, Data collections, Cloud physics, Microwaves, Weather forecasting.

Satellite data are being developed for a variety of applications to thunderstorm research and operational forecasting and warning. The vertical-temperature profile radiometer has been used by NOAA satellites while the visible and infrared spin scan radiometer has been used by NASA. The rapid technological development of human/machine interactive computer systems that permits selective processing of digital satellite data is producing an increased amount of thunderstorm-related research. The NASA space shuttle will eliminate many restrictive weight and size limitations and allow more sophisticated infrared and microwave instruments to be placed in geosynchronous orbit. Satellite imagery is used in thunderstorm detection, monitoring, and forecasting by determining convective rainfall, monitoring movement and intensity of thunderstorm gust fronts, determining severe-thunderstorm/jetstream relationships and thunderstorm boundaries and intersections. Satellite technology has also been helpful in defining cloudtop tornadic signatures, studying mesoscale onvective weather systems, and examining cloudtop temperature fields, cloud motions and wind fields. Satellite technology has also aided studies involving thunderstorm microphysics such as weather modification. (Geiger-PTT)

PROGRESS REPORT: PERFORMANCE C THE VIBRATING U-TUBE FLUID DENSIT GAGE FOR MEASURING SUSPENDED-SED MENT CONCENTRATION,
Geological Survey, Minneapolis, MN. Water R sources Div.
J. P. Beverage.
Available from Fed Inter-Agency Sed Proj, Anthony Falls Hyd. Lab, Minneapolis, MN 5541 U.S. Corps of Engineers, 1984. 16 p, 5 fig, 3 re

Descriptors: Measuring instruments, *Sediment Suspended load, *Settling tubes, *Fluid-densi gage, *Suspended-sediment concentration, *Den ty cell.

The vibrating U-tube fluid-density gage shov promise in automating the measurement of su pended-sediment concentration. The gage may operated with the U-tube in the upright vertic position to increase sensitivity at low sedime concentrations by stopping the flow and letting th sediment settle to the bottom. Sediment with particle-size range of 62 to 1000 micrometers w tested, and the sensitivity of the instrument i creased by a factor of five. The condensation humidity within the case was proved to be th cause of scattered readings at water temperatur below 12C. The gage response is linear with ca pressure. An improved reference oscillator w tested and shown to be satisfactory at ambie temperatures from 15 to 35C. The reference fr quency was increased to 20 kHz from the 12.8 kHz of the earlier studies. Descriptors: *Evaporation, *Mass transfer, Energy budget, Reservoir evaporation, Lake vaporation, Air temperature, Water temperature, Instrumentation, Psychrometer, Micrologger, yranometer.

strumentation currently used by the U.S. Geo-gical Survey in studies of lake and reservoir vaporation is described in this paper. This instru-entation is used for the measurement of solar and rrestrial energy necessary to apply the mass-ansfer or energy budget methods. The energy dget requires a quantative determination of all rm of energy entering or leaving the lake as well determination of the change in storage of energy ithin the lake. (USGS)

DEVELOPMENT AND EVALUATION OF TECHNIQUES FOR THE DETERMINATION OF THE GROUND-WATER POTENTIAL IN THE SOUTHERN ORANGE FREE STATE AND NORTHERN CAPE PROVINCE; VOLUME 5: STATISTICS AND DATA ANALYSIS,
Water Research Commission, Pretoria (South Africa).
G. J. Van Tonder, and F. D. I. Hodgson.
December 1981. 165 p, 29 fig, 25 tab, 33 ref. K5/17.

Descriptors: *Data processing, *Computer programs, *Statistical analysis, *Geohydrology, Mathematical studies, Standard deviation, Correlation coefficients, Cluster analysis, Linear regression, Maps, Contour maps, Graphical analysis, Factor analysis, Principal component analysis, Orange Free State, *South Africa.

A computerized hydrogeochemical data bank is available for users in South Africa. Three groups of programs are described: (1) programs to read data into the computer and obtain an output in the desired format (all data on a single sample or tables of data for multiple samples), (2) programs for statistical analysis (mean, mode, median, standard deviation, correlation coefficients, multiple linear regression, factor analysis, cluster analysis), and (3) programs to obtain graphical representation of data (histograms, Piper diagrams, Schoeller diagrams, sodium adsorption diagrams, contour maps, etc.). EVALUATION OF THE GROUND-WATER RESOURCES OF COASTAL GEORGIA: PRELIMINARY REPORT ON THE DATA AVAILABLE AS OF JULY 1983,
Geological Survey, Doraville, GA. Water Resources Div.
R. E. Krause, S. E. Matthews, and H. E. Gill.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Open-File Report 84-228, 1984. 55 p, 21 fig, 4 tab, 120 ref.

Descriptors: *Hydrologic data, *Groundwater, *Well use, *Georgia, *Coastal area, *Monitoring networks, *Principal artesian aquifer, *Floridan aquifer, Test-well drilling.

A compilation of ground-water data that have been collected for nearly 100 years in the coastal area of Georgia as part of cooperative activities between the U.S. Geological Survey and other agencies is presented in this report. The compilation of pertinent data indicates that information is available for use in the evaluation of the ground-water resources of the 13 counties of coastal Georgia. Included in this report is a fairly complete discussion of previous and ongoing investigations and monitoring networks, and an extensive list of references. Maps at 1:24,000, 1:100,000; and 1:1000,000 scales contain well locations and identifers for all wells in the Ground Water Site Inventory (GWSI) data base of the National Water Data Storage and Retrieval System (WATSTORE). Tabular summaries of selected site information from GWSI, including well identifiers and names, latitude-longitude location, depth of well, altitude of land surface, and use of water are presented. Water-use data from the National Water Use Data System, and water use for irrigation from the University of Georgia, Department of Agriculture survey, are tabulated. Also included are pertinent information on geophysical surveys and data obtained, and proposed project activities, particularly test-monitor well drilling. (USGS)

RECORDS OF SELECTED WELLS, ST. MARYS AND CALVERT COUNTIES, MARYLAND,
Geological Survey, Towson, MD. Water Resources Div.
D. D. Drummond.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. Maryland State Basic Data Report 14, 1984. 117 p, 41 fig, 10 tab, 6 ref.

Descriptors: *Hydrogeologic data, Data collections, *Hydrologic data, *Maryland, *Calvery County, *St. Marys County.

Hydrogeologic data for Calvery and St. Marys Counties in southern Maryland were compiled from previously published and unpublished sources. The report includes records of wells inventoried by the U.S. Geological Survey such as state permit number, owner's name, driller, date drilled, elevation, well depth, aquifer, water-level data, discharge data, specific capacity, use of water, and pump type. Also included are observation well lists, lists of available geophysical logs, descriptive logs, chemical quality analyses, and pumpage data, as well as location maps for all data sites. (USGS)
W86-02359

MASS WATER-LEVEL MEASUREMENTS OF FALL 1984 IN THE CENTRAL PLATTE RIVER BASIN, NEBRASKA,
Geological Survey, Lincoln, NE. Water Resources Div.
J. T. Dugan.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Open-File Report 85-193, 1985. 22 p, 3 fig, 1 tab.

Descriptors: *Groundwater levels, *Observation wells, Data collections, Hydrologic data, *Nebraska, Central Platte River basin, *Water level measurements.

Mass water-level measurements were conducted in the Central Platte River basin, Nebraska, for the purpose of providing data to the U.S. Bureau of Reclamation for the development of a detailed map of water-table conditions during the fall of 1984. The objective was to provide a network of observation wells at approximately 2- to 3-mile intervals. In October and November 1984, 736 wells were measured, of which 526 were measured as part of existing ground-water observation-well networks. The remaining 210 wells not previously measured and required complete inventorying. The report consists of maps of the study area and locations of the observation wells. An appendix of pertinent well data includes: legal location, land-surface altitude, depth-to-water, water-table altitude, date of measurement, and type of well. (USGS)

ANALYSIS OF GROUND-WATER-QUALITY DATA IN MONTANA,
Geological Survey, Helena, MT. Water Resources Div.
R. E. Davis, and G. D. Rogers.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4173, 1984. 177 p, 26 fig, 79 tabs, 56 ref.

Descriptors: *Water quality, Chemical properties, Environmental protection, *Montana, *WATSTORE, *Data collections.

Ground-water-quality data for Montana in the U.S. Geological Survey's computer data file WATSTORE were evaluated for nine geohydrologic units in part of the State east of the Rocky Mountains and for two geohydrologic units in the western mountainous part of the stated region. The availability of data for inorganic, trace, and organic constituents for each grouping of units was assessed. Median dissolved-solids concentrations for the groupings of units range from about 100 to 5,000 milligrams per liter. However, the number and distribution of data sites for some groupings of units wee inadequate to be representative of the aquifer as a whole. Concentrations of most trace constituents do not exceed Federal primary drinking-water standards, although exceptions occur. Few data were available for organic constituents. (USGS)

DRAINAGE BASINS IN ST. JOHNS COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
D. W. Foose.
Available from OFSS, USGS Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4232, 1984. 1 map, 3 fig, 3 tab, 4 ref.

Descriptors: *Drainage basins, Ditches, Divides, Beach, Drainage patterns, Tidal streams, *Maps, *Florida, *St Johns County, Hydrologic units, *Drainage areas.

The highest point in St. Johns County, Florida is only slightly above 65 feet above sea level and drainage divides are indistinct and readily influenced by cultural features. This report delineates some 80 drainage basins (or artificial equivalents to natural basins such as the Intracoastal Waterway) within the county and their areas in square miles. Total area of St. Johns County is about 670 square miles. (USGS)

MAPS SHOWING GROUND-WATER LEVELS, SPRINGS, AND DEPTH TO GROUND WATER, BASIN AND RANGE OF PROVINCE, TEXAS,
Geological Survey, Lakewood, CO. Water Resources Div.
B. T. Brady, M. S. Bedinger, D. A. Mulvihill, J. Mikels, and W. H. Langer.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 83-4121-B. 14 p, 3 fig, 38 ref.

Descriptors: *Groundwater levels, *Springs, *Maps, Basin and Range province, *Texas.

This map report is part of a U.S. Geological Survey project to characterize the geology and hydrology of the Basin and Range province. The report consists of two maps describing hydrologic properties of the Texas part of the Basin and Range province. The first map, at a scale of 1:500,000, shows the approximate altitude of the water table, and the location, temperature, and flow of large springs. The altitude of the water table is shown by contours where sufficient data exists; otherwise it is shown by data points. Springs with flows of 10 gallons per minute or more have been mapped. A second map at a scale of 1:1,000,000 shows the depth to ground water and areas of basin fill or consolidated rocks. In areas where the depth to ground water is less than 500 feet, the depth is shown by lines of equal depth to water or data points where data are insufficient to draw lines. Areas where the depth to the water table is generally greater than 500 feet. (USGS)

WATER-RESOURCES ACTIVITIES OF THE U.S. GEOLOGICAL SURVEY IN MISSOURI, FISCAL YEAR 1985,
Geological Survey, Rolla, MO. Water Resources Div.
W. M. Kratzer, and K. L. Jenkins.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Open-File Report 85-188, 1985. 57 p, 8 fig, 1 tab, 64 ref.

Descriptors: *Missouri, *Hydrologic data, *Networks, Streamflow, *Gaging stations, Data collection, District projects, *Hydrologic reports.

Water-resource activities of the U.S. Geological Survey in Missouri consist of collecting hydrologic data and making interpretive studies. These projects are funded through joint-funding agreements with State and local agencies, transfer of funds from other Federal agencies, and direct Federal funds. These data and the results of the investigations are published or released by either the U.S. Geological Survey or by cooperating agencies. This report describes the hydrologic data-collection program and local or areal investigations in Missouri for fiscal year 1985 and provides a list of selected water-resources references for Missouri. GROUND-WATER DATA FOR GEORGIA, 1984,
Geological Survey, Doraville, GA. Water Resources Div.
J. S. Clarke, S. A. Longsworth, K. W. McFadden, and M. F. Peck.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Open-File Report 85-331, 1985. 150 p, 71 fig, 48 tab, 40 ref.

Descriptors: *Groundwater, *Water levels, Aquifers, *Georgia, Water quality, *Groundwater data, Groundwater levels, Groundwater quality.

Continuous water-level records from 155 wells and more than 800 water-level measurements made in Georgia during 1984 provide the basic data for this report. Selected wells illustrate the effects that changes in recharge and pumping have had on the various ground-water resources in the State. Daily mean water levels are shown in hydrographs for 1984. Monthly means are shown for the 10-year period 1975-84. Mean annual water levels ranged from 7 feet lower to 7 feet higher in 1984 than in 1983. Water-quality samples are collected periodically throughout Georgia and analyzed as part of a real and regional ground-water studies. Along the coast, chloride concentrations in the Floridan aquifer system generally remained steady. (USGS)

GAZATTEER OF HYDROLOGIC CHARACTERISTICS OF STREAMS IN MASSACHUSETTS--MERRIMACK RIVER BASIN,
Geological Survey, Boston, MA. Water Resources Div.
S. W. Wandle, and R. A. Fontaine.
Available from OFSS, USGS, Box 25425 Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4284, 1984. 54 p, 5 fig, 5 tab, 32 ref.

Descriptors: *Drainage area, *Flow duration, *Low flow, *Frequency analysis, Flow characteristics, Streamflow, Surface water, *Massachusetts, Nashua River basin, Concord River basin, Shawsheen River basin, Lower Merrimack River basin, *Maps.

The Merrimack River basin in northeastern Massachusetts includes streams draining the Nashua (507 square miles), Concord (400 square miles), Shawsheen (78.0 square miles), and lower Merrimack (275 square miles) River basins. Drainage areas using the latest available 1:24,000 scale topographic maps were computed for the first time for

treams draining more than 3 square miles and vere recomputed for data collection sites. Stream-ow characteristics at 12 gaging stations were alculated using a new data base with daily flow ecords through 1981. These characteristics in-lude annual and monthly flow statistics, duration f daily flow values, and the annual 7-day mean w flow at the 2-year and 10-year recurrence tervals. Seven-day low-flow statistics are pre-nted for 79 partial-record sites and procedures ed to determine the hydrologic characteristics of basin are summarized. Basin characteristics rep-senting 14 commonly used indices to estimate arious streamflows are presented for 12 gaged reams. This gazetteer will aid in the planning and ing of water-resources related activities, and will ovide a common data base for governmental gencies and the engineering and planning commu-ties. (USGS)

STREAM DISCHARGE IN MICHIGAN--MISCELLANEOUS MEASUREMENTS,
Geological Survey, Lansing, MI. Water Resources Div.
D. J. Holtschlag, and D. V. Eagle.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Open-File Report 85-350, 1985. 344 p, 5 fig, 10 tab, 3 ref.

Descriptors: *Hydrologic data collections, *Streamflow, *Michigan, Discharge, Water yield.

This report contains 17,607 miscellaneous stream discharge measurements made at 2,897 sites in Michigan. An average of 515 measurements were made each year from 1960 through 1984; most of these were made from April through October of each year. Miscellaneous measurements include periodic and occasional measurements of streamflow at sites where systematic records are unavailable. (USGS)
W86-02409

APPROACH FOR APPRAISING THE ACCURACY OF SUSPENDED-SEDIMENT DATA,
Geological Survey, Sacramento, CA. Water Resources Div.
D. E. Burkham.
Available from Distribution Branch, USGS, 604 S. Pickett St., Alexandria, VA 22304. USGS Professional Paper 1333, 1985. 18 p, 4 fig, 1 tab, 14 ref.

Descriptors: *Statistical analysis, *Statistical methods, *Suspended sediments, Sediment discharge, Error analysis, Sediment concentration, Sand, Streams.

Procedures are presented for appraising the accuracy of suspended-sediment data. Types of errors involved are sampling error, spatial error, temporal error, and sediment-discharge error. The standard error of estimate is used to represent errors. Suspended-sediment data for 17 U.S. Geological Survey gaging stations in Arizona, California, Nebraska, New Mexico, Pennsylvania, and Washington are used in applications of the procedures. For the study sites, the magnitudes of the different types of error apparently vary directly with percentage of sediment-water mixture that is sand; when the percentage sand is relatively high, magnitudes of the different types of error have a relatively wide range. For seven sites of the Sacramento River, Calif., and its tributaries, the standard sampling error apparently can range from 2.5 percent when percentage sand is relatively low to 20 percent when percentage sand is relatively high. For 16 sites in Arizona, California, Nebraska, New Mexico, and Pennsylvania, the coefficient of variation for concentrations of suspended sediment

across streams apparently can range from 2.5 percent (low percentage sand) to 70 percent (high percentage sand). (USGS)

GAZETTEER OF HYDROLOGIC CHARACTERISTICS OF STREAMS IN MASSACHUSETTS--HUDSON RIVER BASIN,
Geological Survey, Boston, MA. Water Resources Div.
S. W. Wandle.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 83-4250, 1984. 24 p, 5 fig, 5 tab, 29 ref.

Descriptors: *Drainage flow, *Flow duration, *Low flow, *Frequency analysis, Flow characteristics, Streamflow, Surface water, *Massachusetts, Hoosic River basin, *Maps.

The Hudson River basin includes streams draining the Hoosic River (205 square miles), Kinderhook Creek (20.9 square miles), and Roeliff Jansen Kill (13.3 square miles) basins in western Massachusetts, eastern New York, and southern Vermont. Drainage areas, using the latest available 1:24,000 scale topographic maps, are re-computed for data-collection sites and computed for the first time for streams draining greater than 3 square miles. Basin characteristics representing 14 commonly used indices to estimate various streamflows are presented for the five gaged streams in the Hoosic River basin. Streamflow characteristics, representing statistics computed using a new data base with records through 1979, include annual and monthly flow statistics, duration of daily flow values, and the annual 7-day mean low flow at the 2-year and 10-year recurrence intervals. Seven-day low-flow statistics are presented for 21 partial-record sites. The procedures used to determine the hydrologic characteristics are summarized. This gazetteer of hydrologic characteristics will aid in the planning and siting of water-resources-related activities and will provide a common data base for governmental agencies and the engineering and planning communities. GAZETTEER OF HYDROLOGIC CHARACTERISTICS OF STREAMS IN MASSACHUSETTS--COASTAL RIVER BASINS OF THE NORTH SHORE,
Geological Survey, Boston, MA. Water Resources Div.
S. W. Wandle.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4281, 1984. 60 p, 5 fig, 5 tab, 47 ref.

Descriptors: *Drainage area, *Flow duration, *Low flow, *Frequency analysis, *Flow characteristics, Streamflow, Surface water, *Massachusetts, Rowley River basin, Parker River basin, Ipswich River basin, Mystic River basin, Charles River basin, Neponset River basin, Weymouth River basin, Weir River basin, *Maps.

The coastal river basins of the North Shore and Boston Bay include streams draining the Parker River (60.4 square miles), Rowley River (9.9 square miles), Ipswich River (156 miles), Mystic River (66.0 square miles), Charles River (311 square miles), Neponset River (117 square miles), Weymouth Fore and Weymouth Back Rivers (about 63 square miles) and Weir River (about 20 square miles) basins. The study area in eastern and northeastern Massachusetts also includes the minor river basins draining into Massachusetts Bay, Ipswich Bay, or the Atlantic Ocean. Drainage areas using the latest available 1:24,000 scale topographic maps were computed for the first time for streams draining more than 3 square miles and were recomputed for data-collection sites. Streamflow characteristics at 15 gaging stations were calculated using a new data base with daily flow records through 1981. These characteristics include annual and monthly flow statistics, duration of daily flow values, and the annual 7-day mean low flow at the 2-year and 10-year recurrence intervals. Seven-day low-flow statistics are presented for 95 partial-record sites and the procedures used to determine the hydrologic characteristics of a basin are summarized. Basin characteristics representing 14 commonly used indices to estimate various streamflows are presented for 15 gaged streams. This gazetteer will aid in the planning and siting of water-resources related activities and will provide a common data base for governmental agencies and the engineering and planning communities. GAZETTEER OF HYDROLOGIC CHARACTERISTICS OF STREAMS IN MASSACHUSETTS--CONNECTICUT RIVER BASIN,
Geological Survey, Boston, MA. Water Resources Div.
S. W. Wandle.
Available from OFSS, USGS, Box 25425, Lakewood, CO 80225. USGS Water-Resources Investigations Report 84-4282. 110 p, 10 ill, 5 tab, 39 ref.

Descriptors: *Drainage area, *Flow duration, *Low flow, *Frequency analysis, Flow characteristics, Streamflow, Surface water, *Massachusetts, *Connecticut River basin, *Maps.

The Connecticut River basin study area includes streams draining the Ashuelot River (6.6 square miles), Millers River (389 square miles), Deerfield River (663 square miles), Chicopee River (727 square miles), Westfield River (517 square miles), Farmington River (158 square miles), and Connecticut River lowlands (656 square miles) basin in western Massachusetts, northern Connecticut, southern Vermont, and southern New Hampshire. Drainage areas, using the latest available 1:24,000 scale topographic maps, were computed for the first time for streams draining more than 3 square miles and were re-computed for data-collection sites. Streamflow characteristics at 45 gaging stations, representing statistics were calculated using a new data base with daily flow records through 1981. These characteristics include annual and monthly flow statistics, duration of daily flow values, and the annual 7-day mean low flow at the 2-year and 10-year recurrence intervals. Seven-day low-flow statistics are presented for 118 partial-record sites, and the procedures used to determine the hydrologic characteristics of a basin are summarized. Basin characteristics representing 14 commonly used indices to estimate various streamflows are presented for 54 sites in the Connecticut River basin. This gazetteer will aid in the planning and siting of water-resources related activities and will provide a common data base for governmental agencies and the engineering and planning communities. MODEL STUDY ON WAVE ABSORBERS FOR APPLICATION IN HARBOURS ALONG THE SOUTH AFRICAN COASTLINE,
National Research Inst. for Oceanology, Stellenbosch (South Africa). Coastal Engineering and Hydraulics Div.
D. J. P. Scholtz.
Available from the National Technical Information Service, Springfield, VA 22161 as N83-11686, Price codes: A06 in paper copy, A01 in microfiche. CSIR Report T/SEA 8114, September 1981. 117 p, 73 fig, 7 tab, 20 ref.

Descriptors: *Hydraulics, *Erosion control, *Waves, Harbors, *South Africa, Model studies, Coastal engineering, *Breakwaters, *Shore protection, *Bank protection, Wave absorbers.

The performance of wave absorbers for South African harbors was studied using a model. Tests were done on rubble slopes, dolos slopes, discontinuous composite rubble slopes, patented absorber blocks, and a column wave absorber. Generally, the reflection coefficients were high when the relative depth was low, and vice versa. The wave steepness had an insignificant effect on the reflec tion coefficient in the wave steepness range c 0.004 to 0.024. The individual mean reflection co efficients for dolos slopes and rubble slopes wer similar, 0.37 and 0.35, respectively, for relativ depths of 0.10 and 0.13 and for wave steepness c 0.004-0.024. The reflection coefficients for narrow structures (6.0-6.5 m wide in the model) were hig (0.6-0.8). Smaller reflection coefficients were ob tained for wider structures. For example, reflecte wave heights were 0.3-0.4 for structures 18.00 18.75 m wide in the prototype. With the colum wave absorber, reflected wave height decrease linearly with increase in width. The efficiency o the most effective hollow-block type (column) an of the slope type (composite slope with ratio o depth of top of vertical face of the discontinuou composite rubble slope below SWL to water dept at structure = 0.4) wave absorbers was simila (reflected wave height = 0.5) for w/d (width water depth) = 1. The latter was more efficient fo w/d > 1 and less efficient for w/d < 1. (Cassar PTT)

CONDITION SURVEY OF CEDARS LOCK AND DAM, LOWER FOX RIVER, WISCONSIN
Army Engineer Waterways Experiment Station Vicksburg, MS. Structures Lab.
R. L. Stowe, and J. C. Ahlvin.
Miscellaneous Paper SL-82-4, June 1982. Fina Report. 114 p, 2 fig, 5 tab, 26 plates, 2 app, exhibit, 7 ref.

Descriptors: *Cedars Lock and Dam, *Wisconsin *Dam inspection, Concrete dams, Elastic modulus Shear strength, Triaxial strength, Poisson's ratio

A condition survey was performed at Cedars Lock and Dam on the Lower Fox River, Wisconsin Results of the field investigation and laboratory tests indicated that the concrete in the lock and dam is locally cracked and lightly deteriorated bu structurally sound. Rock masonry in the lock ap pears sound even though the outside surface i weathered. Cycles of freezing and thawing have caused the deterioration. The lock and dam i founded on competent bedrock. Soundings should be made to detect any scouring behind the dam. I is suggested that the reinforced steel in the tainter gate piers, adjacent to the hinge pins, be examined for corrosion. The field investigation included drilling for core samples of concrete, foundation rock, and backfill. Selected specimens of these materials were tested in the laboratory for certain physical and mechanical properties. Data on unit weight, compression wave velocity, compression strength, water content, elastic moduli and Poisson's ratio are presented for concrete cores. Data on effective and dry unit weight, water content compression shear strength are presented for the rock cores. (Author's modified-abstract)

AIR DEMAND AND VIBRATION MEASURE-MENTS, WYNOOCHEE DAM, WYNOOCHEE RIVER, WASHINGTON,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Hydraulics Lab.

E. D. Hart.
Miscellaneous Paper HL-82-2, December 1982. Final Report, 45 p, 10 fig, 5 tab, 16 plates, 13 ref.

Descriptors: *Hydraulics, *Vibrations, *Dams, *Gates, Air demand, Hydraulic structures, *Wynoochee Dam, *Washington, Sluice gates.

Tests were conducted at the Wynoochee Dam, Washington, after vibrations were noted during sluice discharges. The measurement program included (a) the magnitude of vibrations occurring at the dam, the Vista House, and sluice gate, (b) gate-lip pressure fluctuations, (c) air flow rates, (d) the correlation between the gate and Vista House vibrations. Measurements were made with gate openings at 1-ft increments from 1 to 10 ft with an essentially full pool. Some correlation was seen between the frequency of the gate-lip pressure fluctuations and both the accelerations of the Vista House and the air-vent pressure fluctuations during the test with a gate opening of 9 ft. The maximum p-p acceleration recorded during the test was 0.0008 g. The maximum recorded air-vent velocity and head loss were within suggested limits. The ratio of air discharge through the vent and water discharge in the sluice plotted reasonably well on the suggested design curve. Air-vent flow reached a maximum when the sluice gate was fully open. Air flowed into the sluice exit portal at all gate openings for which measurements were made. (Cassar-PTT)

HAND-PUMP TECHNOLOGY FOR THE DEVELOPMENT OF GROUNDWATER RESOURCES,
Agency for International Development, Washington, DC.
J. E. McJunkin, and E. H. A. Hofkes.
In: Water Supply and Sanitation in Developing Countries, Ann Arbor Science, Ann Arbor, MI, 1982. p 37-52, 1 fig, 11 ref.

Descriptors: *Groundwater, *Pumps, *Pump wells, *Water supply development, *Developing countries, Pump testing, Water supply, Water resources development, Maintenance costs, Models, Rural areas.

In areas where groundwater is readily available at moderate depth, constructing a number of wells fitted with hand pumps is by far the cheapest means of providing a good water supply. The most common hand pump is the reciprocating type. Inherent features of the reciprocating hand pump are subject to friction and wear. The diaphragm pump is another type of positive displacement pump. In the rotary-type pump, the helical rotary requires no valves nor cup seals, and in place of the reciprocating lever linkage of the pump head, it has a rotary crank with a right-angle gearbox to turn the rotor. The local manufacture of the hand pump is desireable due to lower capital costs of production, transportation savings, reduction in foreign exchange requirements, stimulation of local initiative, industry and labor, and better availability and access to repair and replacement parts. Most hand-pump maintenance programs can be characterized as a one-level or two-level system. The one-level system is one where all maintenance is the responsibility of the central organization. In the two-level organization, maintenance is shared with local villages or communities. Hand pumps are compared and selected on the basis of relative total cost, capital costs of purchase and installation, plus costs of operation and maintenance. A protocol for evaluating and comparing hand pumps is now under development. (Geiger-PTT)

RENEWABLE ENERGY PUMPING FROM RIVERS AND STREAMS,
Ottawa Univ. (Ontario). Dept. of Civil Engineering.
J. Schiller.
In: Water Supply and Sanitation in Developing Countries, Ann Arbor Science, Ann Arbor, MI, 1982. p 53-64, 6 fig, 1 tab, 6 ref.

Descriptors: *Pump turbines, *Streams, *Pumps, *Water supply development, *Developing countries, Hydraulic equipment, Streamflow, Rivers, Pumping, Pump testing, Water supply, Water resources development, Maintenance costs.

In developing countries, there are many situations where water is available from a nearby stream. Various devices have been constructed to utilize the energy available in flowing streams. This chapter reviews two of the more successful devices: the hydraulic ram pump (hydram) and the low head turbine pump. The hydram converts pressure energy to mechanical work, while the low-head turbine pump converts kinetic energy to mechanical work. The hydram works more efficiently, and in general its capital cost is approximately half that of the Platapump turbine pump. There is, however, ancillary equipment that must be installed with the hydram (feed tank, drive pipe, pump compartment), making it a rather permanent installation. The turbine pump can be installed quite easily with a simple dam, and is fairly temporary and portable. In terms of operation and maintenance, the hydram, with two moving valve parts, would probably be easier to maintain. (Geiger-PTT)

WIND-POWER PUMPING,
Waterloo Univ. (Ontario). Dept. of Mechanical Engineering.
G. M. Bragg.
IN: Water Supply and Sanitation in Developing Countries, Ann Arbor Sciences, Ann Arbor, MI, 1982. p 65-84, 7 fig, 4 tab, 3 ref.

Descriptors: *Pumps, *Pump turbines, *Wind, *Hydraulic equipment, Pumped storage, Pumping, Turbines, Pump testing, Hydraulic machinery, Design criteria, *Windmills.

Several aspects of wind power pumping are outlined, with emphasis on the data needed to decide on the basic types of wind power devices to be used and the availability of wind for power generation. Historically, most windmills have been used for grinding and water pumping. When deciding on windmill location, optimum geographic placement, variation of wind speed with heights and time, and maximum winds for stress analysis should be considered. Windmill designs should be stress-analyzed comprehensively before construction. The most common type of water pumping windmill is the American farm windmill. Many new designs of this type of windmill are becoming available. These new machines are capable of pumping water using positive-displacement pumps at depths up to 200 or more meters. The mechanical simplicity of vertical axis water pumping windmills suggests that machines of this type may become popular in the future. The most common positive-displacement pump for water applications at present is the reciprocating type. In North America, centrifugal pumps have been used to provide water pumping while being driven electrically by submersible motors. In the case of water pumping, the economic and engineering advantages are often strongly in favor of wind power. The peak achievable efficiency for aerodynamic optimization is 0.59, if angular momentum effects, drag and tip losses are ignored. Optimization of a wind turbine connected to a pump or electrical generator is considered. (Geiger-PTT)

8D. Soil Mechanics

INFLUENCE OF A SHALLOW WATER TABLE ON CRATERING,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Structures Lab.
B. L. Carnes.
Technical Report SL-81-6, September 1981. Final Report. 118 p, 21 fig, 10 tab, 9 ref, 4 append. 4A762719AT40.

Descriptors: *Soil mechanics, *Excavation, *Explosives, *Water table, Rapid excavation, Water level, Sand, Craters, Shallow water table.

The influence of a shallow water table on crater shapes and sizes in various types of soils was investigated. Tests using high-explosive charges ranging from 1 to 322 pounds were conducted at four separate sites. Site 1 was a specially constructed sand basin with a variable water table level. Site 2 was a natural sandbar of the Mississippi River near Vicksburg. Site 3 was on a natural sand site in central Florida, and Site 4 was a layered clay/sand site at Camp Shelby, Mississippi. Results showed that craters of drastically different shapes can be formed in the presence of a near-surface water table if the water table is in a highly saturated, loose, granular material. Wide, shallow craters were caused by soil liquefaction in loose, saturated, fine medium-loose sands; however, in a relatively dense sand that was not fully saturated, craters were 5 to 10% smaller in radius and depth than normal (in homogeneous soil), but still regular and bowl-shaped. In a clay/sand environment, craters tended to be about 10 to 15% wider than normal because of sloughing crater slopes of soft clay caused by the shallow water table in the sand.

LABORATORY INVESTIGATION OF PHYSI CAL PROPERTIES OF FLEXIBLE MEM BRANE LINERS (FML),
Carlisle SynTec Systems, PA.
B. D. Gish, and W. E. Witherow.
IN: Toxic and Hazardous Wastes, Technomic Pub lishing Co. Lancaster, PA. 1984. p 510-519, 14 fig

Descriptors: *Membranes, *Impervious mem branes, *Materials testing, *Linings, Materials en gineering, Rubber, Elastomers, Polymers.

A wide spectrum of physical properties, especiall durability and degradation, for the most commo non-reinforced and fabric reinforced flexible mem brane liners (FML's) e.g., butyl and ethylene pro pylene diene monomer (EPDM), rubbers and ther moplastic polyvinyl chloride (PVC), chlorinated polyethylene (CPE) and chlorosulfonated polyeth ylene (CSM) were investigated. All of these mate rials are used widely today in many canal, reser voir, wastewater, and dam projects. Testing wa performed in accordance with the latest America Society of Testing and Materials methods. Wate resistance, tensile strength, elongation, dimensiona stability, and puncture resistance were determine on five commercially available membranes (Buty rubber, EPDM, rubber, thermoplastics CPE, ther moplastic PVC, and Hypalon). Physical character istics were determined after heat aging for 28 day at 70degrees and for 7 days at 116 degrees. Buty rubber showed the least dimensional changes, th highest puncture resistance, good retention of brit tle point, and the least permeability. Thermoplastic PVC and CSM increased in tear resistance afte heat aging. PVC exhibited the worst tensile strength retention after 28 days at 70 degrees (Geiger-PTT)

State Water Resources Research Institute Pro- n, established in 1964, consists of 54 Water ources Research Institutes located at land-grant versities in each of the 50 states and Puerto o, the District of Columbia, Guam, and the gin Islands. The program evolved from the er Resources Research Act of 1964, as amend- the Water Research and Development Act of , Public Law 94-457, and the Water Research Development Act of 1984. These laws author- he following components of the Institute Pro- n: (1) the annual allotment and matching grants gram for the institutes and (2) the additional saline water research programs for organiza- in addition to the State Water Resources earch Institutes. This report summarizes the lative history, budget history, research pro- n development, and program accomplishments. State Water Resources Research Program has administered to by the Office of Water Re- ces Research (OWRR) (1964-1974), the Office Water Research and Technology (OWRT) 4-1982), the Office of Water Policy (OWP) 2-1983), and the U.S. Geological Survey GS) (1983-present). 10. SCIENTIFIC AND TECHNICAL INFORMATION

10C. Secondary Publication And Distribution

PARAHO ENVIRONMENTAL DATA: BIBLI- OGRAPHY,
Development Engineering, Inc., Rifle, CO.
L. K. Talley.
Available from the National Technical Information Service, Springfield, VA 22161 as DE82-019378, Price codes: A02 in paper copy, A01 in microfiche. May 1981. 19 p. EP-78-C-02-4708.A000.

Descriptors: *Bibliographies, *Water pollution effects, *Oil shale, *Coal liquefaction, Toxicity, Land reclamation, Revegetation, Vegetation establishment, Public health, Safety, Leachates.

A bibliography on oil shale processing includes references on process characterization, air quality, water quality, land reclamation and revegetation, biological effects, occupational health and safety, and end use. (Cassar-PTT)
W86-01983

FLUCTUATING WATER LEVELS IN RESER- VOIRS; AN ANNOTATED BIBLIOGRAPHY ON ENVIRONMENTAL EFFECTS AND MAN- AGEMENT FOR FISHERIES,
Fish and Wildlife Service, Fayetteville, AR.
G. R. Ploskey.
Technical Report E-82-5, May 1982. Final Report. U.S. Army Environmental and Water Quality Operational Studies, Army Engineer Waterways Experiment Station, Vicksburg, MS. 142 p. Intra-Army Order WESRF-80-112.

Descriptors: *Bibliographies, *Environmental effects, *Water level fluctuations, *Reservoirs, *Aquatic life, Aquatic habitats, Habitats, Fish, Invertebrates, Aquatic plants, Macrophytes, Productivity, Zooplankton, Limnology, Water quality, Algae, Nutrients, Drawdown, Erosion, Temperature, Water temperature, Turbidity, Falling stage, Rising stage.

The effects of reservoir water level fluctuations on fish is the subject of a 367-reference annotated bibliography. Affected are physicochemical variables, alagae, aquatic invertebrates, fish, fishing, erosion, and reservoir aesthetics. Research on natural lakes, ponds, marshes, and floodplains is included when data contribute to an understanding of aquatic systems in general. A subject index lists several main headings: biology, fish taxa, and limnology (chemical and physical). Examples of subjects under the main headings are fish (with 17 subheadings), drawdown, high water, erosion, temperature, reservoirs, receding waters, and rising waters. (Cassar-PTT)
W86-02033

WATER QUALITY, MACROINVERTEBRATES, AND FISHERIES IN TAILWATERS AND RE- LATED STREAMS: AN ANNOTATED BIBLI- OGRAPHY,
Fish and Wildlife Service, Bowling Green, KY. East Central Reservoir Investigations.
C. H. Walburg, J. F. Novotny, K. E. Jacobs, W. D. Swink, and T. M. Campbell.
Technical Report E-81-8, May 1981. Final Report. U.S. Army Environmental and Water Quality Operational Studies, Army Engineer Waterways Experiment Station, Vicksburg, MS. 200 p. Interagency No. WES 79-04.

Descriptors: *Bibliographies, *Environmental effects, *Reservoirs, *Aquatic life, *Tailwater, Fish, Invertebrates, Aquatic habitats, Habitats, Streams, Dams, Flow, Water quality.

An annotated bibliography lists available literature information on water quality, macroinvertebrates, and fish in tailwaters and related streams. It is divided into two sections: (1) tailwater studies - references which show the project-imposed changes in water flow and quality on the tailwater environment and downstream biota and (2) stream studies - selected references on stream studies which are applicable to tailwater research. (Cassar-PTT)

CASE STUDIES
Treatment Alternatives for Groundwater Contamination,
W86-02110 5F

CATTLE WASTES
Nitrogen, Sulfate, Chloride, and Manganese in Ground Water in the Alluvial Deposits of the South Platte River Valley Near Greeley, Weld County, Colorado,
W86-01941 5B

CEDARS LOCK AND DAM
Condition Survey of Cedars Lock and Dam, Lower Fox River, Wisconsin,
W86-02036 8A

CEMENT
Operating Experience in Hazardous Wastes Disposal by Pozzolanic Cementation,
W86-02042 5E

CENTRAL ARIZONA PROJECT
Class III Survey of the Tucson Aqueduct Phase A Corridor, Central Arizona Project: An Intensive Archaeological Survey in the Lower Santa Cruz River Basin, Picacho Reservoir to Rillito, Arizona,
W86-01995 6G

CHANNEL MORPHOLOGY
Data on Surface-Water Quality and Quantity, Truckee River System, Nevada and California, 1979-81,
W86-01924 5B

CHANNEL SCOUR
Hydraulic and Sediment Characteristics at the North Channel Bridge, Jamaica Bay, New York,
W86-02412 2J

CHELATING AGENTS
Effect of Chelating Agents on the Removal of Heavy Metals by Sulfide Precipitation,
W86-02107 5D

CHEMICAL ANALYSIS
Chlorinated Dioxins and Dibenzofurans in the Total Environment II.
W86-02240 5A

Octanol-Water Partition Coefficient of 1,3,6 TCDD and OCDD by Reverse Phase HPL
W86-02243 5

Analysis of Polychlorinated Dibenzofurans a Dioxins in Ecological Samples,
W86-02246 5

PCB's: Human and Environmental Hazards,
W86-02248 5

PCB Problem: An Overview,
W86-02249 5

Overview of the Scientific Basis for Conce with Polychlorinated Biphenyls in the Gre Lakes,
W86-02250 5

Environmentalist's View of the PCBs in t Great Lakes,
W86-02252 5

Edible Tissue Sampling for Fish Contamina Analysis,
W86-02253 5

Analysis of PCBs Using Specific Isomer Hi Resolution Capillary Gas Chromatography,
W86-02254 5

Biotransformation and Persistence of Polychlo nated Biphenyls (PCBs) in Fish,
W86-02255 5

Economic Impacts of PCB Regulation in Foo Fish,
W86-02256 5

CHEMICAL COAGULATION
Industrial Wastewater Treatability Stu Achieving BCT/BAT Treatment,
W86-02102 5

CHEMICAL PRECIPITATION
Soluble-Sulfide Precipitation Treatment of Met Finishing Wastewater,
W86-02105 5

Co-Precipitation of Heavy Metals with Solub Sulfides Using Statistics for Process Contro
W86-02106 5

Effect of Chelating Agents on the Removal Heavy Metals by Sulfide Precipitation,
W86-02107 5

CHEMICAL PROPERTIES
Conductance: A Collective Measure of D solved Ions,
W86-02261 1

Chemical and Isotopic Characteristics of Brin from Three Oil- and Gas-Producing Formatio in Eastern Ohio, with Applications to the Ge chemical Tracing of Brine Sources,
W86-02365 2

CHEMICAL REACTIONS
Research Program for Atmospheric Chemistr Radiation and Dynamics,
W86-01996 5

Solvent Interactions with Complex, Concentra ed Industrial Wastewaters,
W86-02111 5

Critical Review of Kinetic and Thermodynam Constants for the Aqueous Chlorine-Ammon System,
W86-02138 5

Origin and Nature of Selected Inorganic Co stituents in Natural Waters,
W86-02258 2

Redox Potential: Its Measurement and Impo tance in Water Systems,
W86-02259 2

HEMICAL TREATMENT
Removal of Heavy Metals in POTW Using Alum or Sodium Aluminate for Phosphorus Removal,
W86-02108 5D

Water Treatment Plant Design for the Practicing Engineer.
W86-02188 5F

Effects of Federal Regulations on Water Treatment Plant Design,
W86-02189 5F

Sludge Disposal and the A.P. Black Process,
W86-02193 5F

Flotation Process Used for Calcium Carbonate Recovery from Water Treatment Sludges,
W86-02194 5F

Design of Rapid Mix Units,
W86-02195 5F

Sedimentation,
W86-02196 5F

nstrumentation for Automatic Operation,
V86-02207 5F

Potassium Permanganate for Iron and Manganese Removal and Taste and Odor Control,
V86-02208 5F

Activated Carbon for Taste and Odor Control,
V86-02209 5F

Chemical Conditioning for Water Softening and Corrosion Control,
V86-02210 5F

ime-Soda Softening Processes,
V86-02211 5F

EMISTRY OF PRECIPITATION
olatile Trace-Element Concentrations in nowmelt Contributions to Streams Monitored Hydrologic Bench Mark Network Stations in e Conterminous United States Where Average nnual Snowfall Exceeds 12 Inches,
V86-02397 5B

EMISTRY PROPERTIES
lkalinity and Acidity,
86-02260 2K

ESAPEAKE BAY
ecent Sedimentation Rates in Chesapeake Bay,
86-02077 2L

luences of Submerged Vascular Plants on Ecogical Processes in Upper Chesapeake Bay,
86-02087 2L

vironmental Characterization of Chesapeake y and a Framework for Action,
86-02092 2L

PPEWA RIVER
praisal of the Surficial Aquifers in the Pomme Terre and Chippewa River Valleys, Western nnesota,
86-02357 2F

ORAMINES
mmary of Studies on Modeling Persistence of mestic Wastewater Chlorine in Colorado ont Range Rivers,
6-02141 5B

ect of Bromide and Nitrite on the Degradaof Monochloramine,
6-02143 5B

emistry of Combined Residual Chlorination,
6-02144 5B

lysis of Organic N-Chloramines,
6-02173 5A

Measurement of Residual Chlorine Compounds in Wastewater with Amperometric Membrane Electrodes,
W86-02181 5A

Flow-Stream Determination of Chlorine Species with an Oxygen Amperometric Detector,
W86-02184 5A

CHLORINATED DIBENZOFURANS
Chlorinated Dioxins and Dibenzofurans in the Total Environment,
W86-02233 5A

2,3,7,8-Tetrachlorodibenzo-p-doxin and 2,3,7,8-Tetrachlorodibenzofuran Residues in Great Lakes Commercial and Sport Fish,
W86-02234 5B

Composition of Polychlorinated Dibenzofuran and Dibenzo-p-dioxin Residues in Sediments of the Hudson and Housatonic Rivers,
W86-02237 5A

New Gas Chromatographic Detector for Tetrachlorodibenzo-p-dioxin and Tetrachlorodibenzoburan Analyses,
W86-02238 5A

Validation Study for the Gas Chromatography/ Atmospheric Pressure Ionization/Mass Spectrometry Method for Isomer-Specific Determination of 2,3,7,8-Tetrachlorodibenzo-p-dioxin,
W86-02239 5A

CHLORINATED DIOXINS
Chlorinated Dioxins and Dibenzofurans in the Total Environment,
W86-02233 5A

2,3,7,8-Tetrachlorodibenzo-p-doxin and 2,3,7,8-Tetrachlorodibenzofuran Residues in Great Lakes Commercial and Sport Fish,
W86-02234 5B

Occurrence of Tetrachlorodibenzo-p-dioxin in Environmental Samples from Southwest Missouri,
W86-02236 5A

Composition of Polychlorinated Dibenzofuran and Dibenzo-p-dioxin Residues in Sediments of the Hudson and Housatonic Rivers,
W86-02237 5A

New Gas Chromatographic Detector for Tetrachlorodibenzo-p-dioxin and Tetrachlorodibenzoburan Analyses,
W86-02238 5A

Validation Study for the Gas Chromatography/ Atmospheric Pressure Ionization/Mass Spectrometry Method for Isomer-Specific Determination of 2,3,7,8-Tetrachlorodibenzo-p-dioxin,
W86-02239 5A

CHLORINATED HYDROCARBONS
Chlorinated Dioxins and Dibenzofurans in the Total Environment,
W86-02233 5A

2,3,7,8-Tetrachlorodibenzo-p-doxin and 2,3,7,8-Tetrachlorodibenzofuran Residues in Great Lakes Commercial and Sport Fish,
W86-02234 5B

Determination of 2,3,7,8-Tetrachlorodibenzo-p-dioxin in Industrial and Municipal Wastewaters, Method 613: Development and Detection Limits,
W86-02235 5A

Occurrence of Tetrachlorodibenzo-p-dioxin in Environmental Samples from Southwest Missouri,
W86-02236 5A

Composition of Polychlorinated Dibenzofuran and Dibenzo-p-dioxin Residues in Sediments of the Hudson and Housatonic Rivers,
W86-02237 5A

New Gas Chromatographic Detector for Tetrachlorodibenzo-p-dioxin and Tetrachlorodibenzoburan Analyses,
W86-02238 5A

Validation Study for the Gas Chromatography/ Atmospheric Pressure Ionization/Mass Spectrometry Method for Isomer-Specific Determination of 2,3,7,8-Tetrachlorodibenzo-p-dioxin,
W86-02239 5A

Chlorinated Dioxins and Dibenzofurans in the Total Environment II.
W86-02240 5A

Historical Record of Polychlorinated Dioxins and Furans in Lake Huron Sediments,
W86-02241 5A

Analysis of PCDD-PCDF in Environmental Samples,
W86-02242 5A

Octanol-Water Partition Coefficient of 1,3,6,8-TCDD and OCDD by Reverse Phase HPLC,
W86-02243 5A

Bioavailability of 14C-1,3,6,8-Tetrachlorodibenzo-p-dioxin and 14C-Octachlorodibenzo-p-dioxin to Aquatic Insects in Sediment and Water,
W86-02244 5B

Part per Trillion Residues of 2,3,7,8-Tetrachlorodibenzo-p-dioxin in Michigan Fish,
W86-02245 5B

Analysis of Polychlorinated Dibenzofurans and Dioxins in Ecological Samples,
W86-02246 5A

CHLORINATION
Investigation into the Water Quality Benefits of Chlorinating Papermill Effluents,
W86-02112 5D

Water Chlorination: Environmental Impact and Health Effects; Volume 4, Book 1: Chemistry and Water Treatment,
W86-02135 5F

Review of the Chemistry and Environmental Fate of Reactive Oxidant Species in Chlorinated Water,
W86-02136 5F

Modeling of Reactions Between Aqueous Chlorine and Nitrogenous Compounds,
W86-02137 5D

Critical Review of Kinetic and Thermodynamic Constants for the Aqueous Chlorine-Ammonia System,
W86-02138 5F

Ultraviolet Absorption Spectra of Bromochloramine and Dibromochloramine in Ether,
W86-02139 5F

Dihaloacetonitriles in Chlorinated Natural Waters,
W86-02140 5F

Summary of Studies on Modeling Persistence of Domestic Wastewater Chlorine in Colorado Front Range Rivers,
W86-02141 5B

Natural Dechlorination Kinetics of Secondary Municipal Effluents,
W86-02142 5D

CHLORINATION

Effect of Bromide and Nitrite on the Degradation of Monochloramine,
W86-02143 5B

Chemistry of Combined Residual Chlorination,
W86-02144 5B

Product Distribution and Relative Rates of Reaction of Aqueous Chlorine and Chlorine Dioxide with Polynuclear Aromatic Hydrocarbons,
W86-02145 5B

Reactions of Chlorine and Chlorine Dioxide with Free Fatty Acids, Fatty Acid Esters, and Triglycerides,
W86-02146 5B

Chlorine Demand: Studies Concerning Its Chemical Basis,
W86-02147 5F

Chlorination Products from Aquatic Humic Material at Neutral pH,
W86-02148 5B

Fulvic Acid and Chlorinated Fulvic Acid in Water and Sediment: HPLC Fractionation and Spectroscopic Characterization,
W86-02149 5B

Organic Reaction Products of Chlorine Dioxide and Natural Aquatic Fulvic Acids,
W86-02150 5B

Influence of Aquatic Humic Substance Properties on Trihalomethane Potential,
W86-02151 5B

Empirical Model for Predicting Chloroform Formation from Humic and Fulvic Acids,
W86-02152 5B

Formation of Trihalomethanes from the Halogenation of 1,3-Dihydroxybenzenes in Dilute Aqueous Solution: Synthesis of 2-13 C-Resorcinol and Its Reaction with Chlorine and Bromine,
W86-02153 5B

Kinetics and Mechanism of Haloform Formation: Chloroform Formation from Trichloroacetone,
W86-02154 5B

Quantitative Effects of Bromine on the Formation and Distribution of Trihalomethanes in Groundwater with a High Organic Content,
W86-02155 5B

Formation of Brominated Trihalomethanes: Extent and Kinetics,
W86-02156 5B

Bromoform Production in Tropical Open-Ocean Waters: Ocean Thermal Energy Conversion Chlorination,
W86-02157 5B

Dispersion of Chlorine at Seven Southern California Coastal Generating Stations,
W86-02158 5B

Model for Predicting Chlorine Concentration Within Marine Cooling Circuits and Its Dissipation at Outfalls,
W86-02159 5B

Water Chlorination Programs at Ontario Hydro Fossil-Fired Generating Stations,
W86-02160 5B

Halogenated Organic Study at Selected Tennessee Valley Authority Fossil-Fueled Power Plants,
W86-02161 5B

Organohalogens in Chlorinated Cooling Waters Discharged from Nuclear Power Stations,
W86-02162 5B

Atmospheric Emissions from Electric Power Plant Cooling Systems,
W86-02163 5B

Influence of Prechlorination on the Amount and Toxicity of Micropollutants Extracted from Water at the Morsang Plant,
W86-02168 5B

Formation of Organohalogen Compounds in Chlorinated Secondary Wastewater Effluent,
W86-02169 5B

Formation of Volatile Haloorganic Compounds in the Chlorination of Municipal Landfill Leachates,
W86-02171 5B

Design and Application of Potable Water Chlorination Systems,
W86-02203 5F

Simple Water Treatment Methods,
W86-02331 5F

CHLORINE

New Approaches to the Production of 36 Cl-Labeled Chlorinating Agents and the Measurement of 36Cl Incorporated into Biological Materials,
W86-02172 5A

Review of Analytical Methods for Reactive Oxidant Species in Chlorinated Waters,
W86-02177 5A

Chlorine Analysis: Perspectives for Compliance Monitoring,
W86-02178 5A

Experience with Amperometric Titrations for Total Chlorine in the Micrograms-per-Liter Range: Limitations to Accuracy,
W86-02179 5A

Sensitive, Simple Determination of Oxidants in Chlorinated Waters,
W86-02180 5A

Measurement of Residual Chlorine Compounds in Wastewater with Amperometric Membrane Electrodes,
W86-02181 5A

Simultaneous Kinetic Analysis of Chlorine and Chloramine in Aqueous Solution at Micromolar Concentration Levels,
W86-02182 5A

Improved Determination of Total Residual Chlorine at Low (Microgram-per-Liter) Concentrations in Natural Waters,
W86-02183 5A

Flow-Stream Determination of Chlorine Species with an Oxygen Amperometric Detector,
W86-02184 5A

Hypochlorite and Monochloramine Determinations Using the Silver Iodide Voltammetric Electrode,
W86-02185 5A

Potentiometric Total Residual Chlorine Analysis in a Continuous-Flow System,
W86-02186 5A

Monitoring Total Residual Chlorine by Potentiometric Analysis,
W86-02187 5A

Design and Application of Potable Water Chlorination Systems,
W86-02203 5F

CHLORINE DIOXIDE

Organic Reaction Products of Chlorine Dioxide and Natural Aquatic Fulvic Acids,
W86-02150 5B

CHROMATOGRAPHY

New Methods for Gas Chromatographic Analysis of Water Pollutants,
W86-02174 5A

New Developments in Dynamic Headspac Analysis of Halogenated Organics,
W86-02175 5A

Gas Chromatographic Analysis of Purgeabl Halocarbon and Aromatic Compounds in Drinl ing Water Using Two Detectors in Series,
W86-02176 5A

Summary of Methods for Water-Quality Analysis of Specific Species,
W86-02263 5A

CLARIFICATION

Experimental Study of the Effectiveness of Al minum Chloride for Clarifying Wastewater,
W86-02109 5I

CLAYS

Relationship of Laboratory and Field Dete mined Hydraulic Conductivity in Compacte Clay Soils,
W86-02119 2

CLEANUP

Remedial Action Alternatives for Abandone Hazardous Waste Sites,
W86-02225 5G

CLIMATOLOGY

Annual Average Climatic Maps of the Unite States,
W86-02321 7A

CLOUDS

Photogrammetry of Thunderstorms,
W86-02006 7

COAGULATION

Coagulation,
W86-02192 5

COAL GASIFICATION

Mechanisms for Groundwater Contamination b UCG: Preliminary Conclusions from the Ho Creek Study,
W86-01981 5

COAL LIQUEFACTION

Paraho Environmental Data: Bibliography,
W86-01983 10

COAL MINES

Hydrology of Area 11, Eastern Coal Provinc Ohio, Kentucky, and West Virginia,
W86-01937 2

Simulated Effects of Surface Coal Mining an Agriculture on Dissolved Solids in Rosebu Creek, Southeastern Montana,
W86-01962 5

Acid Mine Drainage: Control and Abatemer Research,
W86-01978 5I

COAL MINING EFFECTS

Geochemical Processes in the Gascoyne Lignit Mining Area, Bowman County, North Dakot
W86-01970 5

COAL REGIONS

Water-Resources Investigations of the U.S. Geo logical Survey in Wyoming, Fiscal Year 198
W86-01926 7

COASTAL AQUIFERS

Ground-Water Quality Data for the Atlanti Coastal Plain: New Jersey, Delaware, Marylan Virginia, and North Carolina,
W86-02374 2

ASTAL AREA
Evaluation of the Ground-Water Resources of Coastal Georgia: Preliminary Report on the Data Available as of July 1983,
W86-02352 7C

ATINGS
Techniques and Materials for Preventing Corrosion,
W86-02214 5F

LIFORMS
Investigation into the Water Quality Benefits of Chlorinating Papermill Effluents,
W86-02112 5D

LORADO
Nitrogen, Sulfate, Chloride, and Manganese in Ground Water in the Alluvial Deposits of the South Platte River Valley Near Greeley, Weld County, Colorado,
W86-01941 5B

Hydrogeologic Data from Parts of the Denver Basin, Colorado,
W86-01952 2F

Evaluation of Rainfall-Runoff Data for the Denver Federal Center, Lakewood, Jefferson County, Colorado,
W86-01956 2E

Assessment of Water Resources at Fort Carson Military Reservation Near Colorado Springs, Colorado,
W86-01969 2E

Grand Valley Salt Pick-up Calculations,
W86-02278 5B

Simulated Effects of an Artificial-Recharge Experiment Near Proctor, Logan County, Colorado,
W86-02344 4B

Hydrology of Area 60, Northern Great Plains and Rocky Mountain Coal Provinces, New Mexico, Colorado, Utah, and Arizona,
W86-02382 2F

Selected Hydrologic Data for the South Platte River Through Denver, Colorado,
W86-02391 5B

Calibration Procedure for a Daily Flow Model for Small Watersheds with Snowmelt Runoff in the Green River Coal Region of Colorado,
W86-02403 2A

Water Resources of the Cottonwood Wash Watershed, Ute Mountain, Ute Indian Reservation, Southwestern Colorado,
W86-02404 2E

ORADO RIVER
Colorado River Salinity - The User's Perspective,
W86-02265 5B

and Valley Salt Pick-up Calculations,
W86-02278 5B

pact of Reservoirs on Seasonal and Historical inity of the Colorado River,
86-02279 5B

storical Trends in Concentration and Load of jor Ions in the Colorado River Systems,
86-02280 5B

ORADO RIVER BASIN
nual Suspended-Sediment Loads in the Green ver at Green River, Utah, 1930-82,
86-01935 2J

PARISON STUDIES
asuring Storm Rainfall by Radar and Rain ge,
86-02009 7B

COMPOSTING
Excreta Reuse Options: Composting and Biogas,
W86-02335 5D

COMPUTER MODELS
Computer Model of One-Dimensional Equilibrium Controlled Sorption Processes,
W86-01925 5B

Locating the Groundwater Pollution Sources Using Computer Models,
W86-02121 5B

COMPUTER PROGRAMS
Development and Evaluation of Techniques for the Determination of the Ground-Water Potential in the Southern Orange Free State and Northern Cape Province; Volume 5: Statistics and Data Analysis,
W86-01993 7C

Municipal Solid Waste Management Facility Location Mapping: Support Activities Report,
W86-02320 5E

CONDUCTANCE
Conductance: A Collective Measure of Dissolved Ions,
W86-02261 1B

CONDUCTIVITY
Conductance: A Collective Measure of Dissolved Ions,
W86-02261 1B

CONFERENCES
Ecological Effects of Acid Precipitation,
W86-02039 5C

CONFINING BEDS
Geology, Hydrology, and Water Quality of the Cambrian and Ordovician Systems in Northern Illinois,
W86-02414 2F

CONNECTICUT
Hydrogeologic Reconnaissance of Stratified-Drift Aquifers Near Simsbury, Connecticut: Available Data and Future Needs,
W86-01967 2K

CONNECTICUT RIVER BASIN
Gazetteer of Hydrologic Characteristics of Streams in Massachusetts--Connecticut River Basin,
W86-02419 7C

CONTROL-GATE RATINGS
Discharge Ratings for Control Gages at Mississippi River Lock and Dam 11, Dubuque, Iowa,
W86-02401 4A

COOLING WATER
Zeta Potential Study of the Water Treatment of Geothermal Brines,
W86-01987 5F

Dispersion of Chlorine at Seven Southern California Coastal Generating Stations,
W86-02158 5B

Model for Predicting Chlorine Concentration Within Marine Cooling Circuits and Its Dissipation at Outfalls,
W86-02159 5B

Water Chlorination Programs at Ontario Hydro Fossil-Fired Generating Stations,
W86-02160 5B

Halogenated Organic Study at Selected Tennessee Valley Authority Fossil-Fueled Power Plants,
W86-02161 5B

Organohalogens in Chlorinated Cooling Waters Discharged from Nuclear Power Stations,
W86-02162 5B

Atmospheric Emissions from Electric Power Plant Cooling Systems,
W86-02163 5B

CORING
Wireline-Rotary Air Coring of the Bandelier Tuff, Los Alamos, New Mexico,
W86-01934 7B

CORROSION CONTROL
Chemical Conditioning for Water Softening and Corrosion Control,
W86-02210 5F

COST ANALYSIS
Development of Energy Efficient Activated Sludge Systems Through Utilization of Nutrient Removal Processes,
W86-02097 5D

Facility Upgrades Due to Hazardous Materials Regulations,
W86-02101 5D

Experimental Study of the Effectiveness of Aluminum Chloride for Clarifying Wastewater,

GAGING STATIONS
Evaluation of the Surface-Water Data Network, Suwannee River Basin, Florida, 1982,
W86-01936 7A

Water-Resources Activities of the U.S. Geological Survey in Missouri, Fiscal Year 1985,
W86-02375 7C

Pragmatic Approach to Evaluating a Multipurpose Stream-Gaging Network,
W86-02417 7A

GAS CHROMATOGRAPHY
Gas Chromatographic Analysis of Purgeable Halocarbon and Aromatic Compounds in Drinking Water Using Two Detectors in Series,
W86-02176 5A

ATES
Air Demand and Vibration Measurements, Wynoochee Dam, Wynoochee River, Washington, W86-02002 8B

EOCHEMICAL DATA
Methods for the Collection of Geochemical Data from the Sediments of the Tidal Potomac River and Estuary, Including Data for 1978-1980 as an Appendix, W86-01930 2L

EOCHEMISTRY
Chemical and Isotopic Characteristics of Brines from Three Oil- and Gas-Producing Formations in Eastern Ohio, with Applications to the Geochemical Tracing of Brine Sources, W86-02365 2K

Regional Aquifer-System Analysis of the Northern Great Plains in Parts of Montana, North Dakota, South Dakota, and Wyoming--Geochemical Evolution of Ground-Water Composition in Two Confined Aquifer Systems, W86-02400 2K

OHYDROLOGIC UNITS
Illinois Ground-Water Observation Network - A Preliminary Planning Document, W86-02355 7A

OHYDROLOGY
Occurrence of Beds of Low Hydraulic Conductivity in Surficial Deposits of Florida, W86-01951 2F

Development and Evaluation of Techniques for the Determination of the Ground-Water Potential in the Southern Orange Free State and Northern Cape Province; Volume 5: Statistics and Data Analysis, W86-01993 7C

Ground-water Monitoring at an Industrial Waste Disposal Site in Pennsylvania, W86-02231 5B

Hydrology of Area 60, Northern Great Plains and Rocky Mountain Coal Provinces, New Mexico, Colorado, Utah, and Arizona, W86-02382 2F

LOGIC FORMATIONS
Geology of the Surficial Aquifer System, Broward County, Florida, W86-02383 2F

Geology, Hydrology, and Water Quality of the Cambrian and Ordovician Systems in Northern Illinois, W86-02414 2F

LOGIC MAPS
Map Showing Outcrops of Granitic Rocks, Basin and Range Province, Utah, W86-01938 8E

Map Showing Outcrops of Thick, Dominantly Argillaceous Sedimentary and Metasedimentary Rocks, Basin and Range Province, Arizona, W86-01945 8E

Map Showing Outcrops of Granitic Rocks, Basin and Range Province, Arizona, W86-01946 8E

Map Showing Outcrops of Pre-Quaternary Basaltic Rocks, Basin and Range Province, Arizona, W86-01947 8E

Map Showing Outcrops of Pre-Quaternary Ash-Flow Tuffs and Volcaniclastic Rocks, Basin and Range Province, W86-01972 8E

Map Showing Outcrops of Granitic Rocks and Pre-Quaternary Ash-Flow Tuffs, Basin and Range Province, Oregon, W86-01973 8E

Map Showing Outcrops of Pre-Quaternary Basaltic Rocks, Basin and Range Province, Oregon, W86-01974 8E

GEOLOGY
Geological Factors in Disposal Site Selection, W86-02043 5E

Geologic and Hydrologic Data Collected During 1976-1984 at the Sheffield Low-Level Radioactive-Waste Disposal Site and Adjacent Areas, Sheffiele, Illinois, W86-02372 2E

GEOPHYSICAL STUDIES
Detection of Subsurface Salinity Within the Northern Slopes Region of Victoria, Australia, W86-02310 7B

GEOPHYSICS
Principal Facts for Gravity Stations in the Humboldt House Geothermal Area, Pershing County, Nevada, W86-02358 8E

GEORGIA
Evaluation of the Ground-Water Resources of Coastal Georgia: Preliminary Report on the Data Available as of July 1983, W86-02352 7C

Ground-Water Data for Georgia, 1984, W86-02376 7C

GLACIAL AQUIFERS
Hydrogeologic Reconnaissance of Stratified-Drift Aquifers Near Simsbury, Connecticut: Available Data and Future Needs, W86-01967 2K

GLACIAL SOILS
Hydrogeology of a Low-Level Radioactive-Waste Disposal Site Near Sheffield, Illinois, W86-02371 2F

Geologic and Hydrologic Data Collected During 1976-1984 at the Sheffield Low-Level Radioactive-Waste Disposal Site and Adjacent Areas, Sheffiele, Illinois, W86-02372 2E

GRANITIC ROCKS
Map Showing Outcrops of Granitic Rocks, Basin and Range Province, Utah, W86-01938 8E

Map Showing Outcrops of Granitic Rocks, Basin and Range Province, Arizona, W86-01946 8E

Map Showing Outcrops of Granitic Rocks and Pre-Quaternary Ash-Flow Tuffs, Basin and Range Province, Oregon, W86-01973 8E

GRAVITY STUDIES
Principal Facts for Gravity Stations in the Humboldt House Geothermal Area, Pershing County, Nevada, W86-02358 8E

GREAT LAKES
Physical Behavior of PCBs in the Great Lakes. W86-02012 5A

PCBs in the Lake Superior Atmosphere 1978-1980, W86-02018 5A

Evidence for the Atmospheric Flux of Polychlorinated Biphenyls to Lake Superior, W86-02020 5B

PCBs in Sediment and Fluvial Suspended Solids in the Great Lakes, W86-02025 5B

Steady State Modeling of Toxic Chemicals-Theory and Application to PCBs in the Great Lakes and Saginaw Bay, W86-02027 5B

Model Simulation of PCB Dynamics in Lake Michigan, W86-02028 5A

Dynamic Mass Balance of PCB and Suspended Solids in Saginaw Bay -- A Case Study, W86-02029 5B

Monitoring of PCBs in Water, Sediments and Biota of the Great Lakes - Some Recent Examples, W86-02030 5A

2,3,7,8-Tetrachlorodibenzo-p-doxin and 2,3,7,8-Tetrachlorodibenzofuran Residues in Great Lakes Commercial and Sport Fish, W86-02234 5B

PCBs in the Great Lakes: Sources, Sinks, Burdens, W86-02251 5B

GROUND WATER
Detection of Subsurface Salinity Within the Northern Slopes Region of Victoria, Australia, W86-02310 7B

GROUND-WATER AVAILABILITY
Availability and Chemistry of Ground Water on the Bruneau Plateau, South-Central Idaho, W86-01963 2F

Hydrogeologic Reconnaissance of Stratified-Drift Aquifers Near Simsbury, Connecticut: Available Data and Future Needs, W86-01967 2K

GROUND-WATER LEVEL
Ground-Water Level Data and Preliminary Potentiometric-Surface Maps, Yucca Mountain and Vicinity, Nye County, Nevada. W86-01964 2F

GROUNDWATER
Water Resources and Effects of Development in Hernando County, Florida, W86-01931 2A

Ground-Water Data for Michigan--1983, W86-01950 2F

Occurrence of Beds of Low Hydraulic Conductivity in Surficial Deposits of Florida, W86-01951 2F

Hydrogeologic Data from Parts of the Denver Basin, Colorado, W86-01952 2F

Ground-Water Resources of Lanfair and Fenner Valleys and Vicinity, San Bernardino County, California, W86-01955 2F

January 1984 Water Levels, and Data Related to Water-Level Changes, Western and South-Central Kansas, W86-01960 2F

Assessment of Water Resources at Fort Carson Military Reservation Near Colorado Springs, Colorado, W86-01969 2E

Geochemical Processes in the Gascoyne Lignite Mining Area, Bowman County, North Dakota, W86-01970 5B

Surface Water Resources of South Africa; Volume I: Drainage Regions A, B-The Limpopo-Olifants System,
W86-01990 2E

Surface Water Resources of South Africa; Volume IV: Drainage Regions E, G, H, J, K, L - The Western Cape,
W86-01997 2E

Salinity in Watercourses and Reservoirs,
W86-02264 5B

Skimming Well Model for Salinity Control,
W86-02285 5G

Chemical Reactions Influencing Salinity Increase of Soil and Groundwaters in the Great Basin, Western United States,

Irrigation as a Solution to Salinity Problems of River Systems,
W86-02305 3C

Reusing Saline Drainage Waters for Irrigation: A Strategy to Reduce Salt Loading of Rivers,
W86-02318 3C

RRIGATION EFFECTS

Summary of Results of an Investigation to Define the Geohydrology and Simulate the Effects of Large Groundwater Withdrawals on the Mississippi River Alluvial Aquifer in Northwestern Mississippi,
W86-02405 4B

RRIGATION EFFICIENCY

Irrigation Scheduling: Applied Timing Criteria,
W86-02124 3F

Energy Utilization and Management in Irrigation,
W86-02125 3F

Crop-Water Production Functions,
W86-02126 3F

RRIGATION PROCEDURES

USDA Planning Process for Colorado River Basin Salinity Control,
W86-02270 5G

RRIGATION-RETURN FLOW

Chemical Quality of Water at 14 Sites Near Kesterson National Wildlife Refuge, Fresno and Merged Counties, California,
W86-01959 5B

RRIGATION WELLS

Appraisal of the Surficial Aquifers in the Pomme De Terre and Chippewa River Valleys, Western Minnesota,
W86-02357 2F

NSAS

anuary 1984 Water Levels, and Data Related to Water-Level Changes, Western and South-Central Kansas,
W86-01960 2F

Hydrology of Prairie Dog Creek Valley, Norton Dam to State Line, North-Central Kansas,
W86-02377 2E

Hydrology of Prairie Dog Creek Valley, Norton Dam to State Line, North-Central Kansas,
W86-02406 4B

STERSON RESERVOIR

Chemical Quality of Water at 14 Sites Near Kesterson National Wildlife Refuge, Fresno and Merged Counties, California,
W86-01959 5B

KINETICS

Natural Dechlorination Kinetics of Secondary Municipal Effluents,
W86-02142 5D

KOOTENAI FORMATION

Regional Aquifer-System Analysis of the Northern Great Plains in Parts of Montana, North Dakota, South Dakota, and Wyoming--Geochemical Evolution of Ground-Water Composition in Two Confined Aquifer Systems,
W86-02400 2K

LAGOONS

Some Ecological Limits to the Use of Alternative Systems for Wastewater Management,
W86-02062 5D

LAHARIC BRECCIA

Map Showing Outcrops of Pre-Quaternary Ash-Flow Tuff and Laharic Breccia, Basin and Range Province, New Mexico,
W86-01939 8E

LAKE MICHIGAN

Vapor Exchange of PCBs with Lake Michigan: The Atmosphere as a Sink for PCBs,
W86-02014 5B

Processes Determining the Flux of PCBs Across Air/Water Interfaces,
W86-02019 5B

Role of Surface Microlayers in the Air-Water Exchange of PCBs,

SURFACE WATER - GROUNDWATER RELATIONSHIPS
Hydrogeology and Effects of Tailings Basins on Hydrology of Sands Plain, Marquette County, Michigan,
W86-01927 2F

SURFACE WATER RECORDS
Cost-Effectiveness of the U.S. Geological Survey Stream-Gaging Program in Arkansas,
W86-01961 7A

SURFACE WATERS
Evaluation of the Surface-Water Data Network, Suwannee River Basin, Florida, 1982,
W86-01936 7A

Sediment and Radionuclide Transport in Rivers: Field Sampling Program for Cattaraugus and Buttermilk Creeks, New York,
W86-01988 5B

Surface Water Resources of South Africa; Volume IV: Drainage Regions E, G, H, J, K, L - The Western Cape,
W86-01997 2E

Surface-Water Inflow to Puget Sound, Washington,
W86-02395 7C

SUSPENDED-SEDIMENT CONCENTRATION
Progress Report: Performance of the Vibrating U-Tube Fluid Density Gage for Measuring Suspended-Sediment Concentration,
W86-02348 7B

SUSPENDED SEDIMENTS
Approach for Appraising the Accuracy of Suspended-Sediment Data,
W86-02415 7C

SUSPENDED SOLIDS
Suspended Solids Removal,
W86-02200 5F

Advanced Techniques for Suspended Solids Removal,
W86-02201 5F

Precoat Filtration,
W86-02202 5F

Theory and Measurement of Turbidity and Residue,
W86-02262 2K

SUWANNEE RIVER BASIN
Evaluation of the Surface-Water Data Network, Suwannee River Basin, Florida, 1982,
W86-01936 7A

SYNOPTIC ANALYSIS
Data on Surface-Water Quality and Quantity, Truckee River System, Nevada and California, 1979-81,
W86-01924 5B

TAILWATER
Water Quality, Macroinvertebrates, and Fisheries in Tailwaters and Related Streams: An Annotated Bibliography,
W86-02035 10C

TAMPA BAY
Appearance and Water Quality of Turbidity Plumes Produced by Dredging in Tampa Bay, Florida,
W86-01929 6G

TECHNOLOGY TRANSFER
History of the State Water Resources Research Institute Program,
W86-02347 9D

TENNESSEE
Test Well Installation and Water Quality, Hollywood Dump Area, Memphis, Tennessee,
W86-01928 5B

TEXAS
Patterns in Prehistoric Settlement: Examining the Distribution of Sites in a Portion of the Colorado River Valley,
W86-01991 6G

Assessing and Managing Effects of Reduced Freshwater Inflow to Two Texas Estuaries,
W86-02090 6G

Municipal Solid Waste Management Facility Location Mapping: Support Activities Report,
W86-02320 5E

Preliminary Study of the Aquifers of the Lower Mesilla Valley in Texas and New Mexico by Model Simulation,
W86-02353 2F

Maps Showing Ground-Water Levels, Springs, and Depth to Ground Water, Basin and Range of Province, Texas,
W86-02366 7C

Maps Showing Ground-Water Units and Withdrawal, Basin and Range Province, Texas,
W86-02367 7C

Water-Resources Activities of the U.S. Geological Survey in Texas--Fiscal Years 1982-84,
W86-02396 7C

THAMES RIVER
Environmental Impact of Pollution Controls on the Thames Estuary, United Kingdom,
W86-02093 5G

THEORETICAL ANALYSIS
Water Analysis, Volume 1: Inorganic Species, Part 1,
W86-02257 5A

THUNDERSTORMS
Thuderstorms: A Social, Scientific, and Technological Documentary. Volume 3: Instruments and Techniques for Thunderstorm Observation and Analysis.
W86-02003 2B

Station Networks for Storm Observation,
W86-02004 7B

Observations from Instrumented Aircraft,
W86-02005 7B

Photogrammetry of Thunderstorms,
W86-02006 7B

Use of Satellite Observations,
W86-02010 7B

TIDAL CURRENTS
Hydraulic and Sediment Characteristics at the North Channel Bridge, Jamaica Bay, New York,
W86-02412 2J

TILAPIA
Potential for Introduction of Three Species of Nonnative Fishes into Central Arizona via the Central Arizona Project - A Literature Review and Analysis,
W86-02322 6G

TOWN OF SIMSBURY
Hydrogeologic Reconnaissance of Stratified-Drift Aquifers Near Simsbury, Connecticut: Available Data and Future Needs,
W86-01967 2K

TOXIC WASTES
Physical Behavior of PCBs in the Great Lakes.
W86-02012 5A

High Resolution PCB Analysis,
W86-02013 5A

Vapor Exchange of PCBs with Lake Michigan: The Atmosphere as a Sink for PCBs,
W86-02014 5B

Physical Chemical Properties of Polychlorinated Biphenyls,
W86-02015 5A

Reactivity and Environmental Persistence of PCB Isomers,
W86-02016 5A

Reversible and Resistant Component Model of Hexachlorobiphenyl Adsorption-Desorption Resuspension and Dilution,
W86-02017 5A

PCBs in the Lake Superior Atmosphere 1978-1980,
W86-02018 5A

Processes Determining the Flux of PCBs Across Air/Water Interfaces,
W86-02019 5B

Evidence for the Atmospheric Flux of Polychlorinated Biphenyls to Lake Superior,
W86-02020 5B

Role of Surface Microlayers in the Air-Water Exchange of PCBs,
W86-02021 5B

PCB Dynamics in Lake Superior Water,
W86-02022 5B

Role of the Benthic Boundary in the Cycling of PCBs in the Great Lakes,
W86-02023 5B

PCB Accumulation in Southern Lake Michigan Sediments: Evaluation from Core Analysis,
W86-02024 5A

PCBs in Sediment and Fluvial Suspended Solids in the Great Lakes,
W86-02025 5B

Estimating Bioconcentration Potential from Octanol/Water Partition Coefficients,
W86-02026 5A

Steady State Modeling of Toxic Chemicals-Theory and Application to PCBs in the Great Lakes and Saginaw Bay,
W86-02027 5B

Model Simulation of PCB Dynamics in Lake Michigan,
W86-02028 5A

Dynamic Mass Balance of PCB and Suspended Solids in Saginaw Bay -- A Case Study,
W86-02029 5B

Monitoring of PCBs in Water, Sediments and Biota of the Great Lakes - Some Recent Examples,
W86-02030 5A

Volatilization of PCB from Sediment and Water: Experimental and Field Data,
W86-02031 5E

Application of a Sediment Dynamics Model for Estimation of Vertical Burial Rates of PCBs in Southern Lake Michigan,
W86-02032 5E

TRACE
Redox Potential: Its Measurement and Importance in Water Systems,
W86-02259 2K

TRACE ELEMENTS
Water Analysis, Volume 1: Inorganic Species, Part 1,
W86-02257 5A

Origin and Nature of Selected Inorganic Constituents in Natural Waters,
W86-02258 2K

Distribution and Transport of Trace Substances in the Schuylkill River Basin from Berne to Philadelphia, Pennsylvania,
W86-02410 5B

TRACE METALS
Origin and Nature of Selected Inorganic Constituents in Natural Waters,
W86-02258 2K

Volatile Trace-Element Concentrations in Snowmelt Contributions to Streams Monitored by Hydrologic Bench Mark Network Stations in the Conterminous United States Where Average Annual Snowfall Exceeds 12 Inches,
W86-02397 5B

TRACER STUDIES
Fates of Uranium and Thorium Decay Series Nuclides in the Estuarine Environment,
W86-02079 2L

TRAINING
O & M Manuals and Operator Training,
W86-02217 5F

Training of Counterparts,
W86-02342 9A

TRAVEL TIME
Data on Surface-Water Quality and Quantity, Truckee River System, Nevada and California, 1979-81,
W86-01924 5B

TRAVELTIME
Time of Travel, Water Quality, and Bed-Material Quality for the Cuyahoga River Within the Cuyahoga Valley National Recreation Area, Ohio,
W86-02389 5B

TRENCHES
Construction Techniques for Remedial Design at a Connecticut Superfund Site: A Case Study,
W86-02118 5G

Slurry Trench Cutoff Walls for Hazardous Waste Isolation,
W86-02226 5G

TRITIUM
Feedwater Cleanup for Combined Electrolysis Catalytic Exchange,
W86-01980 5D

TRITIUM MIGRATION
Hydrogeology of a Low-Level Radioactive-Waste Disposal Site Near Sheffield, Illinois,
W86-02371 2F

TRUCKEE CANAL
Data on Surface-Water Quality and Quantity, Truckee River System, Nevada and California, 1979-81,
W86-01924 5B

TRUCKEE RIVER
Data on Surface-Water Quality and Quantity, Truckee River System, Nevada and California, 1979-81,
W86-01924 5B

TUCSON AQUEDUCT
Class III Survey of the Tucson Aqueduct Phase A Corridor, Central Arizona Project: An Intensive Archaeological Survey in the Lower Santa Cruz River Basin, Picacho Reservoir to Rillito, Arizona,
W86-01995 6G

TUFFS
Map Showing Outcrops of Pre-Quaternary Ash-Flow Tuffs and Volcaniclastic Rocks, Basin and Range Province,
W86-01972 8E

TURBIDITY
Theory and Measurement of Turbidity and Residue,
W86-02262 2K

TURBIDITY PLUMES
Appearance and Water Quality of Turbidity Plumes Produced by Dredging in Tampa Bay, Florida,
W86-01929 6G

TURBULENCE
Turbulence and Mixing in Estuaries,
W86-02072 2L

U.S. VIRGIN ISLANDS
Floods of April 18, 1983 on St. Thomas and St. John, U.S. Virgin Islands,
W86-02362 2E

ULTRAFILTRATION
Water Quality Improvement by Reverse Osmosis,
W86-02213 5F

UNIT HYDROGRAPH
Magnitude and Frequency of Flood Volumes for Urban Watersheds in Leon County, Florida,
W86-02354 2E

UNITED KINGDOM
Environmental Impact of Pollution Controls on the Thames Estuary, United Kingdom,
W86-02093 5G

UNITED STATES
Annual Average Climatic Maps of the United States,
W86-02321 7A

Volatile Trace-Element Concentrations in Snowmelt Contributions to Streams Monitored by Hydrologic Bench Mark Network Stations in the Conterminous United States Where Average Annual Snowfall Exceeds 12 Inches,
W86-02397 5B

URBAN HYDROLOGY
Quality and Quantity of Urban Runoff and Atmospheric Deposition in Urban Areas of Salt Lake County, Utah, 1980-1981,
W86-02346 5B

Effects of Stormwater Runoff on an Urban Lake, Lake Ellyn at Glen Ellyn, Illinois,
W86-02392 5B

URBAN RUNOFF
Quality and Quantity of Urban Runoff and Atmospheric Deposition in Urban Areas of Salt Lake County, Utah, 1980-1981,
W86-02346 5B

URBANIZATION
Effects of Urbanization of Three Ponds in Middleton, Wisconsin,
W86-01949 4C

USER CHARGES
Financing Water Supply Systems,
W86-02338 6C

UTAH
Annual Suspended-Sediment Loads in the Green River at Green River, Utah, 1930-82,
W86-01935 2J

Map Showing Outcrops of Thick, Dominantly Agrillaceous Sedimentary and Metasedimentary Rocks, Basin and Range Province, Utah,
W86-01948 8E

Quality and Quantity of Urban Runoff and Atmospheric Deposition in Urban Areas of Salt Lake County, Utah, 1980-1981,
W86-02346 5B

Ground-Water Hydrology of the Sevier Desert, Utah, with Results of Digital-Computer Modeling,
W86-02351 2F

Maps Showing Ground-Water Units and Withdrawal, Basin and Range Province, Utah,
W86-02368 7C

Hydrology of Area 60, Northern Great Plains and Rocky Mountain Coal Provinces, New Mexico, Colorado, Utah, and Arizona,
W86-02382 2F

Maps Showing Ground-Water Levels, Springs, and Depth to Ground Water, Basin and Range Province, Utah,
W86-02387 7C

VALLEY-FILL DEPOSITS
Nitrogen, Sulfate, Chloride, and Manganese in Ground Water in the Alluvial Deposits of the South Platte River Valley Near Greeley, Weld County, Colorado,
W86-01941 5B

VAPORIZATION
Vapor Exchange of PCBs with Lake Michigan: The Atmosphere as a Sink for PCBs,
W86-02014 5B

VARIABILITY
Field Variability of Soil Physical Properties,
W86-02129 2G

VEGETATION
Potential Consequences of Reject Stream Replacement Projects on Aquatic, Terrestrial, and Recreation Resources: Volume III, Terrestrial Resources.
W86-02011 6G

VIBRATIONS
Air Demand and Vibration Measurements, Wynoochee Dam, Wynoochee River, Washington,
W86-02002 8B

VOLATILITY
Volatilization of PCB from Sediment and Water: Experimental and Field Data,
W86-02031 5B

VOLCANICLASTIC ROCKS
Map Showing Outcrops of Pre-Quaternary Ash-Flow Tuffs and Volcaniclastic Rocks, Basin and Range Province,
W86-01972 8E

WASHINGTON
Results of the Separations Area Ground-Water Monitoring Network for 1981,
W86-01977 5B

Air Demand and Vibration Measurements, Wynoochee Dam, Wynoochee River, Washington,
W86-02002 8B

Transport Variability in a Fjord,
W86-02074 2L

Quality of Ground Water in the Principal Aquifers of Northeastern-North Central Washington,
W86-02345 2K

Phase I Summary and Phase II Plan for Comparing Regulated with Unregulated Streamflow in the Yakima River at Union Gap, Washington,
W86-02378 4A

Surface-Water Inflow to Puget Sound, Washington,
W86-02395 7C

WASTE ASSIMILATIVE CAPACITY
Selected Hydrologic Data for the South Platte River Through Denver, Colorado,
W86-02391 5B

WASTE DISPOSAL
Physical Properties and Leach Testing of Solidified/Stabilized Industrial Wastes.
W86-02001 5E

Hazardous and Toxic Wastes: Technology, Management and Health Effects,
W86-02041 5B

Operating Experience in Hazardous Wastes Disposal by Pozzolanic Cementation,
W86-02042 5E

Geological Factors in Disposal Site Selection,
W86-02043 5E

Siting Hazardous Waste Management Facilities: Theory Versus Reality,
W86-02045 5G

Toxic and Hazardous Wastes,
W86-02094 5D

Hazardous Waste Management for the 80's.
W86-02219 5E

Classification and Management of Process Wastes for the Tennessee Synfuels Associates Coal-to-Gasoline Facility,

W86-02196

WASHINGTON UNIV., SEATTLE. COLL. O OCEAN AND FISHERY SCIENCES.
Surface Foam Chemistry and Productivity in Duckabush River Estuary, Puget Sound, Wa ington,
W86-02085

VATER RESEARCH COMMISSION, PRETORIA (SOUTH AFRICA).
Development and Evaluation of Techniques for the Determination of the Ground-Water Potential in the Southern Orange Free State and Northern Cape Province; Volume 5: Statistics and Data Analysis,
W86-01993 7C

VATER RESOURCES COMMISSION OF IEW SOUTH WALES, SYDNEY AUSTRALIA).
Salinity Control Problems Associated with Irrigation in South-West New South Wales, Australia,
W86-02288 5B

VATERLOO UNIV. (ONTARIO). DEPT. OF IVIL ENGINEERING.
Rooftop Rainwater Catchment Systems for Drinking Water Supply,
W86-02330 3B

Simple Water Treatment Methods,
W86-02331 5F

Wet Method for Excreta Disposal,
W86-02333 5D

Excreta Reuse Options: Composting and Biogas,
W86-02335 5D

ATERLOO UNIV. (ONTARIO). DEPT. OF ECHANICAL ENGINEERING.
Wind-Power Pumping,
W86-02329 8C

ESTVACO CORP., COVINGTON, VA. ARBON DEPT.
Activated Carbon for Taste and Odor Control,
W86-02209 5F

LLIAMS AND WORKS, GRAND RAPIDS, .
Engineering, Energy and Effectiveness Features of Michigan Wetland Tertiary Wastewater Treatment Systems,
W86-02056 5D

SCONSIN UNIV.-MADISON.
Processes Determining the Flux of PCBs Across Air/Water Interfaces,
W86-02019 5B

SCONSIN UNIV.-MADISON. WATER EMISTRY LAB.
PCB Accumulation in Southern Lake Michigan ediments: Evaluation from Core Analysis,
W86-02024 5A

SCONSIN UNIV.-MILWAUKEE. CENTER R GREAT LAKES STUDIES.
low-Stream Determination of Chlorine Species ith an Oxygen Amperometric Detector,
W86-02184 5A

SCONSIN UNIV.-MILWAUKEE. DEPT. OF EMISTRY.
Hypochlorite and Monochloramine Determinations Using the Silver Iodide Voltammetric lectrode,
W86-02185 5A

ODS HOLE OCEANOGRAPHIC TITUTION, MA.
reated Sewage Effluent as a Nutrient Source r Marine Polyculture,
W86-02064 5D

OMING UNIV., LARAMIE. DEPT. OF RICULTURAL ENGINEERING.
echniques for Estimating Irrigation Water Requirements,
W86-02133 2I

XERTEX CORP., HAUPPAUGE, NY.
Measurement of Residual Chlorine Compounds in Wastewater with Amperometric Membrane Electrodes,
W86-02181 5A

[redacted]
